A Partial View of "Valley Farms"

New homes are continually going up on "Valley Farms"—because it is the ideal place for a man to live with his family. Nearby school and store.

Half acres up to ten acres, any size you like, with each little farm bounded by 58 inch fine woven fencing. Deep well on each place. Electricity right at hand at low rates. On St. John's interurban line only 12 minutes from heart of Lansing,—3 miles from State Capitol. Good loam soil, suited to practically everything.

Just the Place for Retired Farmers

The health and freedom of Country Life, with all the conveniences of living in town is offered to you in "Valley Farms."

Sold on Fair Terms

"Valley Farms" is being developed by the same organization that is handling the Westmoreland project for the city man in Lansing—an organization with sufficient capital to do business right. Houses built to suit buyers. Pay cash or part down, as you choose. Prices depend largely on size of farm you want. Phone or write for information.

Michigan Poultry Farm

Insure Yourself a Big Money Making Egg Yield with Our "200-Egg" Pedigree White Leghorns

YOU CAN HAVE a big money making flock—every bird of "200-egg" pedigree—by taking advantage of Michigan Poultry Farm's astonishing Low Price Offer on S. C. White Leghorns. Eggs for hatching! Day old chicks! Choice breeding Cockerels! Michigan Poultry Farm White Leghorns are bred for good size and vigorous constitutions. Our testimonials show early maturity, four months—Continuous laying 54 days consecutively—Flock averages 188 eggs in ten months—Winter averages 65 to 70 per cent.

All males in our breeding pens are sons of hens having pedigrees of 200 to 274 eggs in one year, pedigrees guaranteed by Quisenberry of the Missouri State Experiment Station. All females in our pens are sired by males of "200-egg" pedigree or better.

FREE CIRCULAR AND PRICE-LIST ON REQUEST

When Eggs are High Michigan Poultry Farm layers are on the job. Notice the records for cold weather: Jan. 3, 1916—10 pullets laid in Nov. 199 eggs, Dec. 200—66% production.—G. C. Taggart, Emporium, Pa. Dec. 6—One hen laid 54 eggs in 54 days—Geo. Potter, Ashtabula, O. Nov. 1—4 pullets averaged 188 eggs each in 10 months—Frank Schuster, Oshkosh, Wis. Nov. 22—34 pullets averaged 182 eggs each in 11 months—Chas. Bohn, Milwaukee, Wis. Dec. 5—Your stock won 1st, 2nd, and special at Valley Fair Poultry Show, 1500 birds shown—R. A. Newton, West Brattleboro, Vt.

Poultrymen! Positively The Best Brooder You Can Buy!

The MAGIC BROODER is a revelation to Poultry Raisers. It will brood one to five hundred chicks and do it perfectly.

We use these brooders exclusively on our poultry farm. Poultry Department at the Michigan Agricultural College use and recommend them. Fire never goes out—regulator always dependable—no night attention required—simple and economical to operate—nothing to get out of order. Has both top and bottom draughts, coal magazine and best grate in existence. Large roomy hover fifty inches in diameter gives plenty of room for chicks. Brooder is very durably made and will last a lifetime.

The "Magic" solves the problem of successful poultry raising.

Price only \$15.00

We carry these brooders in stock and can deliver to you promptly. Ask for circular.

INGHAM COUNTY

SOME FACTS AND FIGURES]

INGHAM COUNTY, with a total of 3,508 farms in an area of 553 square miles, is distinctly a farm county. More than 94 per cent. of the entire area of the county is in its farms, and more than 74 per cent. is under cultivation. The farms are, as a rule, of more than average size, less than 4 per cent. being under ten acres. They are almost without exception profitable and correspondingly valuable. The farmers, as a class, are the most prosperous folks in the county. In view of the number of farmers, that is in itself a statement of the wealth of this section.

The farm population of Ingham County is almost exclusively native born. There are 8 per cent. foreign in the entire county, according to the most recent United States Government statistics.

It is interesting to note the number of farms in the county operated by their owners. Of this class there are 2,736, or 78 per cent. One thousand five hundred and seventeen, or 55 per cent. of them are reported free of mortgage debt. This is an exceptionally large percentage. Of the

INGHAM COUNTY

balance, the remarkably low mortgage indebtedness of only 31 per cent. of the entire valuation is carried. Even in the absence of other statistical figures, these mortgage statements alone would indicate exceptional prosperity among Ingham County farmers.

The largest single crop, and the one produced most generally throughout the entire county, is corn, of which 1,323,432 bushels were produced in 1910, a notably bad crop year, but the latest for which authoritative figures are available. Following closely on this for quantity is oats, with a total of 979,048 bushels; potatoes come next, with 357,638 bushels, and beans fourth, with 224,123 bushels. The combined total value of these four crops was in excess of two million dollars.

Everywhere is an atmosphere of hard work. Everyone takes work seriously and as a matter of course. There is no false pride about it, and no failure to realize its importance and its necessity. Rich farmers' wives and sons and daughters take pride in their fine butter, their eggs, their vegetables, their chickens and their stock. The relations between the people of the farms and the people of the county seat are most cordial. The farmers deposit their savings in the local banks, and deal in the local stores.

This directory is published in the belief that it will serve to acquaint the residents of one end of the county with those of the other. We believe it to be accurate. We realize, however, that even in the most carefully compiled and printed books certain errors are bound to appear, and we apologize in advance for any such that may be found by our subscribers.

left 3 months :: :: ::**

WHY DOES PRACTICALLY EVERY SAVINGS BANK IN NEW YORK CITY WHERE THE SAVINGS DEPOSITS AMOUNT TO HUNDREDS OF MILLIONS OF DOLLARS, CONTINUE TO PAY 4% INTEREST ON SAVINGS DEPOSITS? Because savings deposits are worth that rate.

WHY DOES EVERY SAVINGS BANK IN PHILADELPHIA, PITTSBURG, CLEVELAND, TOLEDO, DENVER, SAN FRANCISCO AND PRETTY GENERALLY ELSEWHERE PAY 4% INTEREST ON SAVINGS DEPOSITS? Because Savings deposits are worth that rate.

WHY DO WE PAY 4% INTEREST ON SAVINGS DEPOSITS AS WE HAVE ALWAYS DONE? Because savings deposits are worth that rate.

LANSING, MICHIGAN

Ingham County Farmers' Club.

THE INGHAM COUNTY FARMERS' CLUB

"Growth is better than permanence and permanent growth is better than all"

The Ingham County Farmers' Club is one of the established institutions of the county. Organized February 18, 1872, it has had a continuous, active and useful existence for forty-four years. It is the oldest and most successful Organization of its kind in Michigan; and one of the oldest in the United States.

Its meetings are always open to the public. In this, and also in topics considered, differing from the Grange, which bars the discussion of politics and religion, while this Club has covered the whole range of human endeavor in its papers, addresses and discussions, from the Ten Commandments to the Declaration of Independence.

During its earlier years, topics bearing upon improvements along the lines of agriculture occupied its attention chiefly, while in its later years, subjects pertaining to domestic life, temperance, morality, and live issues of the day, in which human men and women are vitally interested, have occupied the major portion of the time.

The Club membership is composed of about sixty families, largely practical farmers scattered over an area of ten miles square.

Its regular meetings are held the second Saturday of each month, at the homes of the various members. Dinner is served at noon; each family contributing thereto. A table committee of six ladies is appointed for each meeting.

For the first twenty-seven years, it existed as a men's club, hold-

INGHAM COUNTY

ing its meetings in a public hall. When it was reorganized, to admit women, in accordance with the trend of the times, it began holding its meetings at the homes of its members.

The helpful and instructive papers and addresses presented before the Club would make several volumes, worthy of a place in any farm-home library.

The reports of the monthly meetings, published in the local papers, occupy a column of space, and are eagerly sought for by the reading public.

Year books are issued, including lists of officers, and committees, with a program for each monthly meeting, and the hosts for the day.

The naming of farm-homes is a feature which has been loyally carried out by the membership. The following are given as illustrations, some feature of the home suggesting the name "Sunnyside", "Elmside Lawn", "Lone Oak", "Brookdale", "Willowspring", "Pioneer", and "Goodenough".

The Club is auxiliary to the State Association of Farmers' Clubs, and has furnished more officers for that organization than any other of the clubs in the State.

Among the Charter Members, and of those who, during its first years, gave to the Club their loyal support, appear the names of many of the early settlers of the country, who, for years were recognized as the representative farmers of their respective communities.

Of the charter members, but two survive, Col. L. H. Ives and Judge George W. Bristol. (1916.)

During its existence, the Club has had only two presidents. The present incumbent, Col. L. H. Ives, has entered the sixteenth year's service as president. Hon. Amos F. Wood occupied the position over twenty-five years, retiring at his own request by reason of physical disability. He was made president emeritus for the remainder of his life.

Prior to his election as president, Col. Ives was secretary for nearly a quarter of a century. For these services he was presented with a gold watch and chain. Other officers have grown gray in the service of this Club. Re-election has been the reward for faithful services.

Annual dues are fifty cents per family. Junior members are given a place on each program, and otherwise encouraged to improve their birthright privileges. No clan, order, or society in the county gives to its members so large a dividend on the investment made, as The Ingham County Farmers' Club, and no other society has ever been addressed by so many public men in various walks of life.

Evidencing the high moral character and unity of feeling of the membership, it is a matter of record that in the building of the Presbyterian Church, of Mason, the Club appropriated funds, to place a window in the building, which will stand while the church stands, as a memorial of honor.

We are happy to report that the majority of members of this Club are subscribers to our Farm Journal, another evidence of the Club's standards.

FARMERS' DIRECTORY

Michigan State Capitol, Lansing, Michigan.

INGHAM COUNTY DIRECTORY

ABBREVIATIONS.—a, means acres; bds, boards; B tel, Bell telephone; 4 ch, 4 children; H&L, house and lot; Les 10, Leslie Township Road No. 10; O, owns; R1, Rural Route No. 1; ret, retired; T, tenant; 4h, 4 horses; 2c, 2 cattle.

The abbreviations used for the Townships of Ingham County are as follows:

Abieion, Ala.	Leroy, Lry.	Stockbridge, Skbg.
Aurelius, Aur.	Leslie, Les.	Vevay, Vev.
Bunker Hill, Br. Hl.	Locke, Loc.	Wheatfield, Wfd.
Delhi, Del.	Meridian, Mer.	White Oak, Wh. Ok.
Ingham, Ing.	Onondaga, Ono.	Williamston, Wmsn.
Lansing, Lan.		

Names in CAPITALS are those of Farm Journal subscribers—always the most intelligent and progressive people in any county. No Tumbledowns, for no farmer can keep on reading the F. J. and being a Tumbledown, too. Many have tried, but all have to quit one or the other.

Sturdy Stylish Summer Shoes

Honest leathers and honest workmanship combined with a certain smart style distinguish our summer displays of footwear. From the most fashionable pump for women to the sturdy work shoes for men there is no variation in quality. Each is the best of its kind. We now show all the newest lasts and leathers for men, women and children at considerably less than you will pay in shoe shops. We carry complete stocks of:

Beacon Dress Shoes for Men and Boys

Weyenberg Work Shoes for Men and Boys

Julia Marlowe Shoes for Women and Misses

Armor Plate HOSIERY

Best made and best wearing. In black, white and colors. Double heels, soles, toes and garter top. Shown in a variety of the new shades also. All sizes. Finest hosiery value on the market.

and fair, without extravagant claims or knocking.

MASON

MICHIGAN

I extend hearty greetings to the farmers of Ingham
County and respectfully solicit your patronage.

If you wish to sell or exchange your farm for either
city or country property, see me. I have farms for
sale or trade in all parts of the State, and will be
happy to serve you in any possible way. If you should
desire to make a change come in and talk it over.

Drain Tile That LASTS

We've been making that kind for a good many years now and haven't had any "come-backs" yet. A good many hundred farmers in Ingham and hereabouts are draining their farms with Clippert-Spaulding Drain Tile. Write us, giving us a description of the land you wish drained, and we will give you an approximate estimate as to the cost per acre for drainage.

When you can get Drain Tile, Building Bricks and Blocks made right here in Ingham and sold at bottom prices, why not keep your money in your own neighborhood? It's cheaper in every way. Ask us what our prices are.

Cow Ailments and How to Treat Them

(From the Biggle Cow Book)

Let sick or maimed animals lie still. Do not torture them by trying to get them up. Rub their limbs every day and keep a soft bed under them. They will get up when they are able.

If a cow look poor and weak, put a blanket on her, keep her in a warm place, and feed her some corn meal and middlings, and some oats. Give her warm drink, and stir a little cheap flour in it. Do not let her run clear down. Look ahead.

If cows are accidentally left out in a rain and seem cold, put them in the stable as soon as possible and rub them well. If they shiver, put blankets on them until they are dry. If there is inflammation or hardness in the udder, bathe it thoroughly for at least half an hour, and rub gently until thoroughly dry.

If this does not effect a cure put a warm flaxseed poultice on the udder, which can be held in place by means of an eight-tailed bandage. This should be changed twice a day until the hardness and soreness are gone. Of course, the cow should be milked out two or three times each day.

If a cow get a foreign body in the mouth turn her head towards the light and remove it.

When chaff or other dirt gets into the eye syringe or sponge the eye frequently with clean cold water containing sulphate of zinc one grain to each ounce of water. Keep stable darkened.

For CHOKING, examine throat and neck; if offending object is felt, attempt to force upward into the mouth by pressure of hands below the object. Give one pint linseed oil or melted lard. May sometimes reach with hand by holding tongue aside. Do not push a stiff stick or fork handle down the throat; a piece of rubber hose, well greased, is less likely to ruin the cow.

If a cow has BLOAT or HOVEN there will be a drum-like swelling on left side in front of hip, caused by green food, wet or frosted clover, overfeeding, choking. Give one-half teacupful table salt in water, as drench. Exercise. If not relieved give aromatic spirits of ammonia, two ounces, well diluted, every hour.

Where there is great danger of suffocation a puncture of the paunch may be made with a knife at a point, equally

distant from the point of hip and last rib, on *left side of cow*.

IMPACTION OF PAUNCH is caused by overeating, and the symptoms are failing appetite, solid or doughy swelling on front of left hip. Give one to two pounds Glauber salts dissolved in water; follow every three hours by drench of mixture of equal parts common salt, nux vomica powdered and capsicum. Dose, one tablespoonful.

In COLIC the symptoms are uneasiness, striking belly with hind legs, lying down and getting up. Cause, change of diet, rapid feeding. Give Glauber salts, one pound in water; warm water enemas. Give every hour one ounce each of laudanum and sulphuric ether, diluted.

CONSTIPATION caused by dry, coarser food and lack of exercise, is treated with green food, linseed meal and exercise; give pint of raw linseed oil. DIARRHŒA is treated with starch gruel or flour and water and dry food.

SCOURS in calves is caused by overfeeding, bad food or drink, damp stables, dirty surroundings. Remove cause and withhold food the best remedy. Give once daily twenty grains potassium permanganate in tincup of water; also use same for enema.

Cows are subject to FOUNDER, showing sudden tenderness in two or more feet; feet hot and may crack around top of hoof. This comes from overfeeding. Give Glauber salts one pound, twenty drops tincture aconite every two hours. Keep feet moist by wet pasture or wet cloths.

GARGET or SWOLLEN UDDER, due to cold, injuries, overfeeding or heating food. Bathe frequently with warm water; dry, and apply warm lard. Milk often. Give internally two-drachm doses salicylic acid and one drachm soda bicarbonate in one pint of milk four times daily.

DISCHARGE OF MUCUS from nostrils indicates catarrh from exposure, dust, or pollen of plants. Allow animal to breathe steam from water containing pine tar.

In SORE THROAT there is difficulty in swallowing, food returns through nostrils. Steam as in catarrh, give tincture belladonna one-half ounce every six hours. Rub throat with equal parts turpentine and sweet oil.

In BRONCHITIS there is dry cough first,

then loose, and discharge from nostrils; rattling sound in windpipe. Steam as in sore throat and give tincture aconite twenty drops every two hours and two drachms muriate ammonia in one pint of water three times daily. For bronchitis in young stock due to worms in windpipe, which sometimes occur in autumn where they are pastured late, give one ounce turpentine and six ounces sweet oil well mixed three times a week. Take from pasture and feed liberally.

In PNEUMONIA there is loss of appetite, animal standing, rapid breathing, pulse frequent, extremities cold. Cause, exposure or neglected bronchitis. Place in a warm, dry, well-ventilated stable, apply to chest equal parts turpentine and alcohol and cover with blanket. In beginning give tincture aconite twenty drops every hour. If not better in two days discontinue aconite and give one ounce tr. digitalis every eight hours.

In PLEURISY there is fever with rapid pulse, animal stands, grunts on moving or when chest is struck, has a short painful cough. Treat same as for pneumonia; give also one drachm iodide of potash twice daily.

SORE TEATS are caused by scratches from briars, bites of insects, dirt exposure, also from the contagion of cow pox at milking. Remove cause and use milk tube if necessary; apply to sores after milking small quantity of mixture glycerine four ounces and carbolic acid one drachm. In cow pox milk affected cow last and apply to sores mixture glycerine four ounces, water eight ounces, chloride of zinc twenty grains.

WARTS on teats or other parts are generally easily removed by sharp scissors; dress wound as advised for sore teats.

MANGE causes great itching and generally starts at root of tail or top of neck; cause, a minute parasite. Wash with soap and water and dry, after which apply lard which destroys the parasite.

For LICE and TICKS apply daily a tea made by adding one pound quassia chips to three gallons of boiling water. Ordinary sheep dip is also effective. Carbolic acid is one of the most effective agents against parasites. It should have a dilution of about one hundred times its bulk of water. Kerosene emulsion is good for lice on cattle, killing both adults and eggs. To make, dissolve one-half pound hard soap in one gallon hot water and while still near the boiling

point add two gallons kerosene oil. Churn or agitate until emulsified. Use one part of this emulsion to eight or ten parts of water and use as a spray, wash or dip.

In RINGWORM there are circular spots of baldness covered by gray or yellow crust; caused also by a parasite. Wash with strong soap and water and apply pure creolin once daily for a week.

FOUL CLAW or HOOF DISTEMPER causes lameness in one or more feet, swelling and heat around top of hoof, and bad smelling discharge around edge of hoof and between the claws. Cause, dirty stables, standing in stagnant water or mud. Trim off all loose horn, clean by wiping with dry rags, wet sores twice daily with mixture chloride of zinc one ounce, water one pint.

OVERGROWTH OF HOOF from standing in stable should be filed off with rasp.

SPRAINS (generally below knee or hock), causing heat and lameness with tenderness at point of injury, should be bathed with warm water or with laudanum three parts, lead water one part.

WOUNDS, if bleeding much, fill or cover the wound with clean cotton dipped in cold or quite warm water, and secure firmly with bandage; examine for foreign bodies, as splinters, nails and dirt. Do not fill wound with cobwebs to stop bleeding. Remove the bandage before swelling takes place; one application of bandage usually enough. Keep animal quiet first day, then allow exercise. Keep wound clear and apply carbolic acid water 5 per cent. or creolin and water 1 to 10. Do not apply grease to wounds. If proud flesh forms apply daily enough powdered burnt alum to cover.

For an ABSCESS or cavity containing pus caused by bruises, etc., open freely and syringe with 10 per cent. creolin solution.

LOCKJAW, a constant muscular spasm involving more or less the entire body, is caused by the entrance of tetanus germs through a wound. There is stiffness of whole or part of body, more frequently the jaws, making eating difficult or impossible. If animal can drink give one-half ounce doses bromide potash five times daily; dissolve and place on food or gruel or in water given to drink. Do not drench, and keep quiet.

INVERSION OF VAGINA most frequent in springers, caused most frequently by stalls too low behind. Treat displaced parts with warm water and replace them.

Place cow in stall eight inches higher behind than in front until after calving.

INVERSION OF WOMB occurs after calving, same cause as above and treatment the same; get womb placed well forward.

STERILITY in bull is sometimes caused by high feeding and lack of exercise. Give nux vomica one drachm and capsicum one-half drachm once daily. In cow may be temporary, following abortion; if from other cause, seldom recover. Try same remedy as for bull.

ABORTION is a frequent and troublesome malady, occurring generally at about seventh or eighth month. Cause may be due to injuries or to contagion. Separate at once when suspected; after calf is born syringe the womb with one gallon of warm water containing one ounce creolin. Repeat daily as long as any discharge is seen. Afterbirth should be removed about third day after calving. Disinfect stables thoroughly. Do not let cow take bull for at least two months after aborting.

RETAINED AFTERBIRTH is generally due to premature birth; should be removed on third or fourth day. Blanketing, warm stable, warm drinks may help. If necessary to remove by hand, should only be attempted by qualified person, otherwise it is advisable to allow it to remain.

INFLAMMATION OF THE WOMB is indicated by fever, loss of appetite, straining. Caused by injuries in calving or to attempts at removal of afterbirth, and is generally fatal. Give two drachms salicylate of soda every four hours and syringe womb with warm water and two ounces creolin to the gallon.

MILK FEVER or PARTURIENT APOPLEXY is usually treated by inflation of the udder with air. Doubtless a regular "milk fever outfit," costing about \$3, is best to use, as it precludes the possibility of infecting the sensitive interior of the udder. But in emergency, or in case the outfit is not procurable, the udder may be inflated by using a bicycle or automobile air pump, taking pains to be sure the air used is pure. If in a stable, ventilate it well.

Attach a milking tube to the tubing of the pump, first dipping it in a carbolic solution (carbolic acid three teaspoons, water one pint). Wash each teat carefully with this antiseptic, before inflating it, so as to prevent infection. Insert the milking tube carefully. Work slowly.

Of course the udder must not be inflated unreasonably. After inflation, remove the tube and leave the udder full of air for five to eight hours. Then the air may be worked out gently, and, if necessary, the inflation may be repeated.

Cows so treated usually show marked signs of improvement within two hours.

ACTINOMYCOSIS (LUMP JAW) is a contagious disease due to a germ known as "Ray fungus." There are well-defined swellings about the jaw, head and throat, or may be on the tongue or in the lungs. These soften and open after a time and discharge matter; appetite good until well advanced. The treatment is, remove by surgical means; late experiments indicate iodide of potash two to three drachms daily to be a cure. Advanced cases should be killed at once. The meat should never be used for food.

MILK SICKNESS (TREMBLES) is a disease of cattle communicable to man and other animals by use of meat or milk; dry cattle most commonly and far more severely affected. Milch cows may transmit this disease through the use of their milk and yet show no trace of the disease themselves. The symptoms are trembling upon least exertion as walking, great prostration and delirium. Treatment is only prevention; do not use pastures known to produce this disease; unbroken land of certain districts unsafe.

RHEUMATISM is shown by hot, painful swellings at the joints, generally the hocks, stiffness in walking or may be unable to rise. Bathe joints with camphor and alcohol and give internally two drachms salicylate of soda every three hours until four ounces have been given; keep warm and dry and give laxative food.

TEXAS FEVER, a disease of Southern cattle which, when transmitted to Northern cattle, is generally fatal in a few days. The spread of the disease is generally due to ticks; those from diseased animals contain the germs of the disease and by their bites transmit it. The indications are a high fever, staggering gait, urine of reddish brown to black, great prostration, unconsciousness, death. Most common in summer months; unknown in the north after heavy frost. Prevention, avoidance of cattle from Southern fever districts; dipping of Southern cattle to destroy the ticks.

Hog Ailments and How to Treat Them

(From the Biggle Swine Book)

More has been spoken and written on the subject of hog cholera than upon any other one subject connected with hogs. It has ever been a fruitful source for discussion at farmers' institutes and an endless theme on which to write. The Government has appropriated large sums of money and has employed learned men who have labored with seeming diligence for years, and yet after all these years of waiting and all this expenditure of money we are forced to admit, whether humiliating or not, that we know but very little that is of practical benefit about the whole matter.

But two things are absolutely known about the disease. One is that it sweeps unrestrained over vast areas of country, leaving death and destruction in its wake; and the other is that hogs which contract the disease usually die.

We shall not attempt to deal with this subject in a scientific way, but shall deal with it rather from a practical standpoint.

A somewhat recent means of preventing the disease is the serum or antitoxin cure. It consists in introducing into the system of the animal a serum which enables the body to more successfully combat the disease. The Government officials seem to be highly pleased with the results so far and seem to believe that relief from the dread disease is likely to come through this means. The serum produced last year, wherever used in cholera-infected herds, saved over eighty per cent. of the animals. It is easily applied, and its good effects in sick hogs are seen almost immediately.

Page after page has been written as a means of telling hog cholera, but much of it is difficult of comprehension to the average reader. If you have never had it in your herd you are to be congratulated on your good fortune; and if you ever do, when you are done with it you may not have as many hogs as you did before, but rest assured of one thing, and that is you will know hog cholera when you see it again. As a rule hogs do not look well for weeks before an attack. At other times it will come like a bolt of lightning from a clear blue sky. The first thing noticeable is a loss of appetite: the hair will look harsh and dry; sometimes a slight cough will be noticeable, at other times not.

The disease is sometimes of slow development, at other times quite rapid. Instead of the sprightly, rapid movement so characteristic of the young and growing hog, he moves slowly and indifferently; he looks gaunt and tired; his back is arched, and he moves his hind legs with a dragging motion; his temperature will most likely be high, probably from 104 to 108—the normal temperature of the hog is from 100 to 102. His bowels may be constipated or the discharges may be thin and watery in substance, but usually black or dark in color, emitting an offensive odor peculiar to the disease.

The disease may be of a lingering character and the animals linger for weeks, or they may die in three or four days. Usually the lingering type is less fatal than the more rapid forms of the disease. Hogs which discharge freely in the first stages of the disease are more likely to recover than when the bowels remain constipated. Dark blue spots will often appear under the skin. The bowels will be more or less inflamed inside; in the small intestines and sometimes in the stomach will be found ulcers; this, however, is not common in the first stages of the disease. The bladder will most likely be full of a dark thick substance, showing that the kidneys, and in fact the whole internal organism, are affected.

If we were to say what we thought was the best thing that could possibly be done when cholera appears in a herd, we would unhesitatingly say, take the well hogs to clean new quarters where no hogs have been for years. Then if more of them take sick move them again, and it is our belief based on actual experience that more can be accomplished in this way than by the use of all the medicine in the country. For various reasons it is not always possible to move hogs, and in that case treatment may be resorted to, sometimes with fairly good results. The treatment should consist in separating the well from the sick hogs, and in dividing the sick hogs according to age and size and severity of the attack. Not more than four or five hogs should be in the same pen, and fewer would be still better. Feed but little, and let that be food which is easily digested. Use air-slacked lime and crude carbolic acid freely as a disinfectant. Use it both on the hogs and on the ground, in

the sleeping places, on the fences and in the drinking vessels. As much depends on a thorough use of disinfectants as upon any other thing. If the bowels are constipated give something to move them. If too loose give something to check them. In short, use good common horse sense (so to speak) and you will usually succeed very well. There is nothing better than salts or oil to move the bowels, and nothing shows better results in checking them than a few drops of crystal carbolic acid. We know of no food better, if indeed as good, for sick hogs than ship stuff, or middlings as it is sometimes called; it seems to digest easily and is soothing to the bowels.

If the weather is wet and cold keep the hogs dry and warm. In wet weather (if not too warm) keep the hogs in a floored pen, or at least in a pen where no water will lie in sinks or holes, as dirty water is one of the worst things a sick hog can possibly have. If the weather is warm, shelter the hog from heat. In other words, make him as comfortable as possible.

Let it be borne constantly in mind that much depends on good nursing. It would seem natural and reasonable that an animal afflicted as he is would do best if allowed plenty of fresh water to drink, but actual experience demonstrates that a greater number recover when the supply of water is limited than when it is not.

Hogs that are very sick should be kept by themselves, as others seem to disturb them, and often their recovery depends on being perfectly still at the critical period of the disease. As a rule hogs that are too sick to eat die. All hogs that die of cholera, or of any other disease for the matter of that, should be burned and not buried, as abundant evidence can be produced to prove that the carcasses of hogs dying of cholera have been the cause of an outbreak years afterward. By all means burn all dead hogs as the only absolutely safe way of disposing of them. The burning operation is very simple. Lay the bodies across two logs, sticks or pieces of iron that will keep them up off the ground so that the fire can get under them, and the grease from their own bodies will usually do the work, with a little wood or corn cobs added occasionally.

Experience teaches that the disease more commonly appears in large herds than in small ones. The moral of this, then, is easily understood. Do not keep

hogs in large droves. Not over twenty-five or thirty hogs at most should long remain together, and half the number would be infinitely better and safer in every way. Hogs of different sizes and ages should not be kept together, excepting of course sows and suckling pigs. Hogs should not be kept on the same ground from year to year if it can possibly be avoided. Plow up the lots and pens and cultivate them for a year or two; it will greatly assist in keeping your lots free from the germ. The disease is much more prevalent in the summer and fall months than in other seasons of the year. Then as far as is possible reduce the number of hogs on the farm at this season of the year.

If your neighbor's hogs have the disease, stay away from his pens and be sure he stays away from yours. Shoot a crow, a buzzard, or a stray dog that comes on your place as unhesitatingly as you would kill a mad dog. This trio does more to scatter the disease than all the other causes combined. If your hogs are fit or any way near fit to go to market when the disease makes its appearance in the neighborhood, sell them without delay. "A bird in hand is worth two in a bush." If your hogs have cholera this year, don't get discouraged and quit, but try it again, on fresh ground.

If your brood sows have passed through the cholera, keep them; they are valuable. They will never again have the disease, and their pigs are not nearly so apt to contract it as pigs from sows that have not had the disease. Look out for streams which come down from some neighbor above you. This has been found a frequent cause of cholera outbreaks. The germs of hog cholera possess great vitality, and will live in the soil, in moist matter and especially in water, for months.

If you feed corn, rake the cobs together often and burn them; pour water on the coals and then put salt on the charcoal thus made and you have an excellent preventive for diseases, with little or no cost. Keep your hogs, excepting brood sows, ready for market. It may come handy some day. Strong, vigorous hogs are less liable to contract the disease than hogs of less strength and vigor. Then breed and feed for both these things. Eternal vigilance in hog breeding, as in other kinds of business, is the price of success.

Here is a formula for the treatment of hog cholera that is probably as good as

any, which is not saying much. It is suggested by the Department of Agriculture:

Sulphur1 pound.
 Wood charcoal.....1 pound.
 Sodium chloride.....2 pounds.
 Sodium bicarbonate...2 pounds.
 Sodium hyposulphite..2 pounds.
 Sodium sulphate.....1 pound.
 Antimony sulphide...1 pound.

Thoroughly mix and give a large tablespoonful to each 200-pound hog, once a day. If the animal does not eat, add the medicine to a little water, thoroughly shake and give from a bottle by the mouth. If the animal will eat, mix the medicine with sloppy food. The same remedy is recommended as a preventive to those animals that do not as yet show signs of disease.

If you have had cholera on your place, and you have small, inexpensive pens, burn them at once. In a piggery, burn all the litter and loose inexpensive parts; renew the floor, if possible, and disinfect the remainder by washing it with hot water and washing soda. After washing, apply with a whitewash brush, or better yet a spray pump, a solution of one part of carbolic acid to fifty parts of water. Then thoroughly whitewash. Treat the fences in the same way. Earth floors should be removed to a depth of at least six inches and the ground sprinkled with chloride of lime and a few days later a good coating of air-slacked lime. Don't put pigs in the quarters for at least six months, and, if possible, have them vacant over the first winter.

An Ohio breeder of large experience, in the Miami valley, where hog cholera first appeared in 1856 and has recurred at frequent intervals, holds that drugs, virus and antitoxin have all been fairly tried sundry times by him and his neighbors. He believes that prevention will do more to hold in check the plague than drugs and hypodermic infusions. The most important help to prevent spread of disease is not to allow the hog farm to become infected with the excrement of diseased hogs. This can be done by quarantining the herd in a field, that is to be put under cultivation the following year. This quarantine must be established as soon as the first pig is taken sick. If the disease is in the neighborhood, carefully watch for first symptoms of disorder. Do not wait until several are sick and scouring, for this excrement is loaded with germs of disease, and these germs may retain vitality many

months when covered in the corners of pens, or filth of yards, or about an old straw stack; but when exposed to sunlight or dryness they lose vitality in a few days, and under some very drying sunlight conditions in a few hours. Carefully observing these facts, he has in forty years been clear of hog cholera the year following an attack, and on until the disease has become epidemic in his neighborhood. After the herd has been placed in quarantine away from the permanent hog houses, lots and feeding floors, he kills and burns, or buries five feet deep, each animal as soon as it shows distinct symptoms of disease. They are burned or buried beside the quarantine, and in the field to be cultivated the following year. It requires nerve to kill breeding stock of great value, but they are as liable to spread and entail disease as any other, when once attacked.

If, by any means, we can prevent spread of germs, by so much do we hold the disease in check. A farm, with its feed lots and pens and shelters infected by the excrement of the diseased, becomes as deadly a centre as the public stock-yards and filthy stock cars on the railroads, and these are so thoroughly infected that we can never safely take stock hogs from these to our farms. This is not theory, but well proven fact.

Pig ailments are numerous; we shall speak only of some of the most common.

It is always best to give medicines mixed with food or drink where possible. If the animal refuses food or drink and it is necessary to administer drugs, it may be done by placing a stout chain (an ordinary harness breast chain does very well) within the mouth and well back between the jaws, which are thus kept from crushing the bottle. Two or three men are necessary for the undertaking, one or two to hold the chain and one to pour the medicine. The head should be well elevated, which places the pig on his haunches. Do not pour the medicine fast enough to strangle the animal.

Hogs will not do well when the skin is covered with filth. Bad air will bring on coughs; all corn for food, fever; a wet bed, rheumatism; and a big bunch together will breed disease. With a clean skin, good air, a variety of food, a dry bed and a few together, and lots of out-of-doors, they will do well.

When at pasture they find many roots, nuts and pebbles, besides being continually active, which does more than food

for their hearty health, rapid and easy digestion and speedy, profitable growth.

THUMPS.—This disease is quite common (especially in the early spring) and is exceedingly hard to handle when once contracted. More can be done to prevent than to cure. You visit the sow and litter in the morning to give them their accustomed feed, and you notice that one of the fattest and plumpest ones does not leave his bed as do the others. You enter the sleeping room and compel him to come out, which he does somewhat reluctantly, and you will notice that his sides move with a peculiar jerking motion, and if allowed he will soon return to his bed. Rest assured he has thumps, and nine chances to one he will die. It is caused by fatty accumulations about the breast, which interfere with its action, and the lungs work hard—pump for dear life to keep up the heart's action—to send the blood through the body. The pig is faint because of feeble circulation, and he is cold, and soon dies from exhaustion or weakness. He has no strength to suck or move.

To prevent thumps, get over into the pen several times a day and hustle the little pigs about the pen; also stint the sow so that she will give less milk. Pigs when they stir about, and when they are thin in flesh, rarely have thumps.

Thumps rarely occurs among pigs farrowed after the weather is fine, but does quite frequently occur among pigs farrowed in early spring. If the weather is cold and stormy and the sow and litter keep their bed much, then be on the lookout for thumps. Guard against it by compelling both sow and litter to exercise in the open air.

CANKEROUS SORE MOUTH is a disease which is quite common and which if not promptly taken in hand is often quite fatal. When pigs are from a few days to two weeks old, you may notice a slight swelling of the lips or a sniffing in the nose. An examination will show a whitish spongy growth on the sides of the mouth just inside the lips or around the teeth. This is cankerous sore mouth, and if not taken promptly in hand will result in the death of the entire litter, and will sometimes spread to other litters.

Some claim the disease is caused by damp and filthy beds, others say it comes from a diseased condition of the sow, and still others claim it is caused by the little pigs fighting over the teats and wounding each other with their sharp

teeth, and stoutly aver that if the teeth are promptly removed no case of sore mouth will ever occur.

Hold the pig firmly and with a knife or some cutting instrument remove all the spongy foreign growth, and be sure you get it all even though the pig may squeal and the wound bleed; your success in treating the disease will depend largely on the thoroughness with which you remove this foreign growth. After removing the fungous growth apply an ointment made of glycerine and carbolic acid in about the proportion of one part of the acid to from five to eight parts glycerine. Repeat this each day for three or four days and the disease will usually yield. You may discover in a day or two after commencing treatment that you did not succeed in removing all the cankerous growth at first, and if so, repeat the cutting operation till you do remove it all.

Another treatment which we have heard recommended is to catch the diseased pig and dip his nose and mouth up to his eyes in chlora naphtholeum without diluting it. This is certainly easily done and is highly commended by the person suggesting it.

BLIND STAGGERS, INDIGESTION, SICK STOMACH, FOUNDER.—Causes, over-feeding, especially common with new corn; sour or decayed food. Sudden warm sultry weather predisposes in highly fed hogs. Insufficient exercise is also a predisposing cause.

Symptoms.—Loss of appetite, bowels constipated, or maybe diarrhoea. In some severe cases blind staggers and great paleness of mouth and nose, coldness of surface of body; abdomen may be distended and drum-like from contained gases.

Treatment.—Remove sick animals, provide clean, dry, well ventilated quarters, with chance for exercise, and fresh earth and water. If animal will eat, give light feed. Give charcoal in lump form, also mix soda bicarbonate in food at rate of two tablespoonfuls per day to each half-grown animal. It is rarely necessary to drench with medicine. If recovery begins, use care not to again feed too much.

MILK FEVER occurs in sows immediately after farrowing or within the first few days afterwards. The symptoms are loss of milk, swollen, hard condition of the milk glands, which are more or less painful on pressure. Sow may not allow the pigs to suck; she may lie flat on her

belly or stand up, and in extreme cases the sow has spells of delirium, in which she may destroy her young.

Cause.—Injudicious feeding, overfeeding on milk-producing foods. Do not feed sow quite full rations for few days just before and after farrowing.

Treatment.—Give sow plenty of cool clean water; bathe the swollen glands for half hour at a time with water as warm as she will bear, dry thoroughly with soft cloth and give good dry pen. If bowels seem constipated give the sow internally one-half pint pure linseed oil. (Never use the boiled linseed oil used by painters; it is poisonous.) If the sow starts killing her young, or has no milk for them, it is best to take most of them, or all, away from her and feed by hand with spoon or ordinary rubber nipple and bottle. For this use one part boiled water and three parts cow's milk. The pigs may be returned to the sow if her milk returns.

Scours among pigs is another common and very troublesome though not dangerous disease. This disease is not confined to any particular season, but is more common in the wet, damp weather of April and early May than in other seasons of the year.

As in thumps, remove the cause. This disease is almost invariably caused by some improper food eaten by the sow. A sour swill barrel is often the cause. It should be borne in mind that pigs once affected will be more liable to a recurrence of the disease than those never affected, and greater care should be used with them for some weeks till they fully recover.

CONSTIPATION.—Cause, improper feeding, exclusive grain diet, lack of exercise. Not dangerous in itself, but frequently followed by prolapsus of the rectum, or what is commonly called piles. The constant straining causes this. The only remedy is laxative food and exercise. The protruding bowel must be washed clean as soon as seen and well covered with olive oil or lard. It should then be returned by applying firm pressure with the hand, and when once in place should be retained by three or more stitches of waxed linen or heavy silk thread, passed from side to side through the margins of the opening, care being used to take a deep hold in the skin.

While this operation is being done the animal should be held by the hind legs by two assistants, thus elevating the hind

quarters. Allow stitches to remain two or three weeks.

RHEUMATISM.—A disease of the joints, manifested by pain, heat and lameness, with swelling of one or several joints. There may be high fever and loss of appetite. May be acute and rapid in its course, or slow, chronic and resulting in permanent enlargements of the bones of the legs, especially the knee and hock.

Causes.—Primarily deranged digestion, lack of exercise; dampness and exposure to draughts of cold air also a cause. The tendency to rheumatism is hereditary in certain families of hogs.

Treatment.—Endeavor to prevent by proper exercise, food and attention to surroundings. Do not breed rheumatic specimens even if fully recovered from lameness. In acute cases an adult hog should have twice or three times daily one drachm salicylate soda.

ASTHMA sometimes occurs in adult hogs.

Symptoms.—Shortness of breath on least exercise, noisy breathing, more or less intermittent. Do not breed; butcher early.

CONGESTION OF THE LUNGS sometimes occurs, the result of driving or chasing. May be rapidly fatal.

Symptoms.—Sudden shortness of breath and sudden great weakness. The hog is not adapted to rapid driving; if it must be driven at all, give plenty of time.

PNEUMONIA (LUNG FEVER) may follow congestion of the lungs; may be induced by crowding too many hogs together, when they heat and become moist, after which they are in poor condition to withstand cold.

Symptoms.—Loss of appetite, chills, short cough, quick breathing.

Treatment.—Separate sick at once from the drove; give dry quarters with abundance of dry bedding; tempt appetite with small quantities of varied food. Apply to sides of chest, enough to moisten the skin, twice daily, alcohol and turpentine equal parts; continue until skin becomes somewhat tender.

TETANUS (LOCK-JAW).—Caused by introduction into the system of the tetanus bacteria, which gains entrance through a wound.

Symptoms.—A stiffness of more or less the entire muscular system, generally most marked in the jaws, which are greatly stiffened. Eating very slow, or entirely stopped; appetite not lost.

Treatment.—Some cases recover if

carefully nursed. Give nourishing drinks, elevate trough or bucket so the patient can get its snout into the drink; give dissolved in hot water and mixed with the slop forty grains bromide of potash two or three times daily until improvement is noticed. Do not attempt to drench. Any wound which seems to be a cause should be cleansed and wet often with five per cent. solution of carbolic acid and water.

LICE.—Very commonly found upon hogs. They are introduced by new purchases or by visiting animals.

Caution.—Examine the newly purchased hog well on this point before placing with the drove. Hog lice are quite large and easily detected on clean white animals, but not readily on dark or dirty skins.

Remedy.—Wash well with soap and water, if weather is not too cold, then warm water, if weather is not too cold, then apply enough petroleum and lard, equal parts, to give the skin a complete greasing. If weather is too cold for washing, clean with stiff brush. Creolin one part to water five parts is also a safe and sure remedy. Two or more applications are necessary at intervals of four or five days to complete the job. The wood-work of pens and rubbing places must be completely whitewashed.

MANGE.—Caused by a microscopic parasite which lives in the skin at the roots of the bristles.

Symptoms.—Intense itching with redness of the skin from the irritation of rubbing. Rather rare, but very contagious.

Treatment.—Separate diseased animals; scrub them thoroughly with warm water and strong soap; apply ointment composed of lard, one pound; carbonate of potash, one ounce; flor. sulphur, two ounces; wash and re-apply every four days.

MAGGOTS.—The larvæ of the ordinary blow-fly frequently infests wounds on hogs during the summer months. Watch all wounds during hot weather; keep them wet frequently with creolin one part and water six parts, or five per cent. watery solution carbolic acid. If the maggots gain entrance to the wound, apply either above remedies freely, or ordinary turpentine with a brush or common oil can.

ROUND WORMS.—Very common in shotes and young hogs, not apparently harmful, unless in great numbers, when they cause loss of flesh. They may be

exterminated by keeping the hog without food for twenty-four hours, and giving to each shote or old pig one tablespoonful of turpentine thoroughly beaten up with one egg and one-half pint of milk.

TUBERCULOSIS (CONSUMPTION).—A contagious disease common in man, cattle and not rare in the hog.

Symptoms.—Loss of flesh, cough, diarrhœa, swelling about the head and neck, which may open and discharge with little tendency to heal; death in from few weeks to months. Post mortem shows various sized tubercles, which may be situated in any part of the body, most commonly in the bowels, lungs, liver, or glands of the neck.

Causes.—Direct contagion from other hogs, but generally from feeding milk from tuberculous cows, or by eating butcher offal from such cows.

Prevention.—Care as to the source of the milk fed; if suspicious, boiling will render it safe. Do not feed butcher offal; separate suspicious hogs at once, and if satisfied they are tuberculous, kill and bury deep, or burn them. The tuberculin test can be applied to the remainder of drove, as without it it is impossible to say how many may be diseased.

WOUNDS generally heal readily in the hog if kept clean and free from maggots. The result of neglected castration wounds is sometimes serious. Have the animal clean as possible when castrated, and endeavor to keep it clean and give opportunity for abundant exercise until wound is healed. There is probably nothing better and safer to apply to wounds of the hog than creolin one part, water six parts.

TRAVEL SICKNESS.—Similar to ordinary sea-sickness in man; very common in shipping pigs by wagon.

Symptoms.—Vomiting, diarrhœa, great depression; seldom if ever fatal. May be rendered much less severe by very light feeding before shipment.

To Find the Amount of Wall Paper Required to Paper a Room

Measure the distance around the room deduct the width of each window and door, take two-thirds of result. Divide this result by the number of strips that can be cut from each roll and you have the number of rolls required. A roll is generally a foot and a half wide, 24 feet long and contains 36 square feet, or 4 square yards.

Poultry Diseases and Enemies

(From the Biggle Poultry Book)

Many of the ills that poultry flesh is heir to are directly traceable to bad breeding and treatment. In-and-in-breeding is practiced and the law of the survival of the fittest is disregarded until the stock becomes weak and a prey to disease.

Yards and runs occupied for any considerable time become covered with excreta and a breeding ground for all manner of disease germs.

Dampness from leaky roofs or from wet earth floors, and draughts from side cracks, or from overhead ventilation slay their thousands yearly.

A one-sided diet of grain, especially corn, moldy grain or meal, decayed meat or vegetables, filthy water, or the lack of gritty material are fruitful sources of sickness.

In the treatment of sick birds much depends on the nursing and care. It is useless to give medicine unless some honest attempt be made to remove the causes that produce the disturbance. Unless removed the cause will continue to operate and the treatment must be repeated.

It is an excellent plan to have a coop in some secluded place to be used exclusively as a hospital. If cases cannot be promptly treated it is better to use the hatchet at once and bury deeply, or burn the carcasses. This is the proper plan in every case where birds become very ill before they are discovered.

Sick birds should in no case be allowed to run with the flock and to eat and drink with them.

In giving the following remedies we make no pretence to a scientific handling of the subject.

FEVERS, from colds, fighting of cocks, etc. Symptoms: unusual heat of body, red face, watery eyes and watery discharge from nostrils.

Give dessertspoonful citrate of magnesia and, as a drink, ten drops of nitre in half a pint of water.

APOPLEXY AND VERTIGO, from overfeeding or fright. Symptoms: unsteady motion of the head, running around, loss of control of limbs. Give a purgative and bleed from the large veins under wing.

PARALYSIS, from highly seasoned food and over stimulating diet. Symptoms: inability to use the limbs, birds lie helpless on their side. Treatment—The same as for apoplexy.

LEG WEAKNESS occurs in fast-growing young birds, mostly among cockerels. A fowl having this weakness will show it by squatting on the ground frequently and by a tottering walk. When not hereditary it usually arises from a diet that contains too much fat and too little flesh and bone-making material, such as bread, rice, corn and potatoes. To this should be added cut green bone, oats, shorts, bran and clover, green or dry. Give a tonic pill three times a day made of sulphate of iron, 1 grain; strychnine, 1 grain; phosphate of lime, 16 grains; sulphate of quinine, ½ grain. Make into thirty pills.

CANKER OF THE MOUTH AND HEAD.—The sores characteristic of this disease are covered with a yellow cheesy matter which, when it is removed, reveals the raw flesh. Canker will rapidly spread through a flock, as the exudation from the sores is a virulent poison, and well birds are contaminated through the soft feed and drinking water. Sick birds should be separated from the flock and all water and feed vessels disinfected by scalding or coating with lime wash. Apply to sores with a small pipet syringe or dropper the peroxide of hydrogen. When the entire surface is more or less affected, use a sprayer. Where there is much of the cheesy matter formed, first remove it with a large quill before using the peroxide. A simple remedy is an application to the raw flesh of powdered alum, scorched until slightly brown.

SCALY LEG, caused by a microscopic insect burrowing beneath the natural scales of the shank. At first the shanks appear dry, and a fine scale like dandruff forms. Soon the natural scale disappears and gives place to a hard, white scurf. The disease passes from one fowl to another through the medium of nests and perches, and the mother-hen infecting her brood. To prevent its spread, coat perches with kerosene and burn old nesting material and never use sitting hens affected by the disease. To cure, mix ½ ounce flowers of sulphur, ¼ ounce carbolic acid crystals and stir these into 1 pound of melted lard. Apply with an old tooth brush, rubbing in well. Make applications at intervals of a week.

WORMS in the intestines of fowls indicate disturbed digestion. Loss of appetite and lack of thrift are signs of their presence. Give santonin in 2-grain doses

six hours apart. A few hours after the second dose give a dessertspoonful of castor oil. Or, put 15 drops of spirits of turpentine in a pint of water and moisten the feed with it.

BUMBLE-FOOT, caused by a bruise in flying down from perches or in some similar manner. A small corn appears on the bottom of the foot, which swells and ulcerates and fills with hard, cheesy pus. With a sharp knife make a cross cut and carefully remove all the pus. Wash the cavity with warm water, dip the foot in a solution of one-fourth ounce sulphate of copper to a quart of water and bind up with a rag and place the bird on a bed of dry straw. Before putting on the bandage anoint the wound with the ointment recommended for scaly leg or coat it with iodine.

GAPES, caused by the gape-worm, a parasite that attaches itself to the windpipe, filling it up and causing the bird to gasp for breath. The worm is about three-fourths of an inch long, smooth and red in color. It appears to be forked at one end, but in reality each parasite is two worms, a male and female, firmly joined together. This parasite breeds in the common earth worm. Chicks over three months old are seldom affected. If kept off of the ground for two months after hatching, or on perfectly dry soil, or on land where affected chicks have never run, chicks will seldom suffer from the gapes. Old runs and infested soil should have frequent dressings of lime.

In severe cases the worms should be removed. To do this put a few drops of kerosene in a teaspoonful of sweet oil. Strip a soft wing feather of its web to within an inch of the tip, dip in the oil, insert feather in windpipe, twirl and withdraw. Very likely some of the parasites and mucus will come with it. The rest will be loosened or killed, and eventually thrown out. It may be necessary to repeat the operation.

To kill the worm in its lodgment, gum camphor in the drinking water or pellets of it as large as a pea forced down the throat is recommended. Turpentine in the soft feed, as advised in the treatment for worms in the intestines, is said to be effective. Pinching the windpipe with the thumb and finger will sometimes loosen the parasite.

When broods are quartered on soil known to be infested, air-slacked lime should be dusted on the floor of the coop, and every other night, for two or three weeks, a little of the same should

be dusted in the coop over the hen and her brood. To apply, use a dusting bellows and only a little each time.

CHOLERA is due to a specific germ, or virus, and must not be confounded with common diarrhoea. In genuine cholera digestion is arrested, the crop remains full, there is fever and great thirst. The bird drinks, but refuses food and appears to be in distress. There is a thickening of the blood, which is made evident in the purple color of the comb. The discharges from the kidneys, called the urates, which in health are white, become yellowish, deep yellow, or, in the final stages, a greenish-yellow. The diarrhoea grows more severe as the disease progresses. A fowl generally succumbs in two days. The virus of cholera is not diffusible in the air, but remains in the soil, which becomes infected from the discharges, and in the body and blood of the victims. It may be carried from place to place on the feet of other fowls or animals. Soil may be disinfected by saturating it with a weak solution of sulphuric acid in water. Remove at once all well birds to new and clean quarters and wring the necks of all sick birds and burn their carcasses and disinfect their quarters.

For cases not too far gone to cure give sugar of lead, pulverized opium, gum camphor, of each, 60 grains, powdered capsicum (or fluid extract of capsicum is better, 10 drops), grains, 10. Dissolve the camphor in just enough alcohol that will do so without making it a fluid, then rub up the other ingredients in the same bolus, mix with soft corn meal dough, enough to make it into a mass, then roll it and divide the whole into one hundred and twenty pills. Dose, one to three pills a day for grown chicks or turkey, less to the smaller fry. The birds that are well enough to eat should have sufficient powdered charcoal in their soft feed every other day to color it slightly, and for every twenty fowls five drops of carbollic acid in the hot water with which the feed is moistened.

ROUP.—The first symptoms are those of a cold in the head. Later on the watery discharge from the nostrils and eyes thickens and fills the nasal cavities and throat, the head swells and the eyes close up and bulge out. The odor from affected fowls is very offensive. It is contagious by diffusion in the air and by contact with the exudations from sick fowls. To disinfect houses and coops burn sulphur and carbollic acid in

them after turning the fowls out and keep closed for an hour or two. Pour a gill of turpentine and a gill of carbolic acid over a peck of lime and let it become slaked, then scatter freely over the interior of houses and coops and about the yards.

For the first stages spray the affected flock while on the roost or in the coop with a mixture of two tablespoonfuls of carbolic acid and a piece of fine salt as big as a walnut in a pint of water. Repeat two or three times a week. Or, if a dry powder is preferred, mix equal parts of sulphur, alum and magnesia and dust this in their nostrils, eyes and throat with a small powder gun. The nasal cavities should be kept open by injecting with a glass syringe or sewing machine oil-can a drop or two of crude petroleum. A little should be introduced also through the slit in the roof of the mouth. Give sick birds a dessertspoonful of castor oil two nights in succession, and feed soft food of bran and corn meal seasoned with red pepper and powdered charcoal. A physician advises the following treatment: hydrastin, 10 grains; sulph. quinine, 10 grains; capsicum, 20 grains. Mixed in a mass with balsam copaiba and made into twenty pills; give one pill morning and night; keep the bird warm and inject a saturated solution of chlorate potash in nostrils and about 20 drops down the throat.

PIP, so-called, is not a disease but only a symptom. The drying and hardening of the end of the tongue in what is called "pip" is due to breathing through the mouth, which the bird is compelled to do because of the stoppage of the nostrils. By freeing the natural air passages the tongue will resume its normal condition.

DIPHThERIA is a contagious disease. The first symptoms are those of a common cold and catarrh. The head becomes red and there are signs of fever, then the throat fills up with thick, white mucus and white ulcers appear. The bird looks anxious and stretches its neck and gasps. When it attacks young chicks it is frequently mistaken for gapes. When diphtheria prevails, impregnate the drinking water with camphor, a teaspoonful of the spirits to a gallon of water, and fumigate the house as recommended for roup.

Spray the throat with peroxide of hydrogen or with this formula: 1 ounce glycerine, 5 drops nitric acid, 1 gill water. To treat several birds at once with medi-

cated vapor, take a long box with the lid off, make a partition across and near to one end and cover the bottom with coal ashes. Mix a tablespoonful each of pine tar, turpentine and sulphur, to which add a few drops, or a few crystals, of carbolic acid and a pinch of gum camphor. Heat a brick very hot, put the fowls in the large part and the brick in the other, drop a spoonful of the mixture on the brick and cover lightly to keep the fumes in among the patients. Watch carefully, as one or two minutes may be all they can endure. Repeat in six hours if required.

CROP-BOUND.—The crop becomes much distended and hard from obstruction of the passage from the crop to the gizzard by something swallowed; generally, it is long, dried grass, a bit of rag or rope. Relief may sometimes be afforded by giving a tablespoonful of sweet oil and then gently kneading the crop with the hand. Give no food, except a little milk, until the crop is emptied. Wet a tablespoonful or more of pulverized charcoal with the milk and force it down the throat. Should the crop not empty itself naturally pluck a few feathers from the upper right side of it and with a sharp knife make a cut about an inch long in the outer skin. Draw this skin a little to one side and cut open the crop. Remove its contents, being careful not to miss the obstruction. Have a needle threaded with white silk ready, and take a stitch or two in the crop skin first, then sew up the outer skin separately. Put the patient in a comfortable coop, and feed sparingly for a week on bran and meal in a moist state, and give but little water.

SOFT OR SWELLED-CROP arises from lack of grit, or from eating soggy and unwholesome food. The distended crop contains water and gas, the bird is feverish and drinks a great deal. By holding it up with its head down the crop will usually empty itself. When this is done give teaspoon doses of charcoal slightly moistened twice at intervals of six hours. Restrict the supply of water and feed chopped onions and soft feed in moderation.

EGG-BOUND, DISEASES OF THE OVIDUCT. Overfat hens are often troubled in this way. Forcing hens for egg production will sometimes break down the laying machinery. Give green food, oats, little corn, and no stimulating condiments. Let the diet be plain and cooling in its

nature. To relieve hens of eggs broken in the oviduct, anoint the forefinger with sweet oil and deftly insert and draw out the broken parts. When the hen is very fat and the egg is so large it cannot be expelled, the only way to save the hen is to break the egg and remove it as above directed.

WHITE-COMB OR SCURVY, caused by crowded and filthy quarters and lack of green food. The comb is covered with a white scurf. This condition sometimes extends over the head and down the neck, causing the feathers to fall off.

Change the quarters and diet, give a dose of castor oil and follow this with a half a teaspoonful of sulphur in the soft food daily.

RHEUMATISM AND CRAMP caused by cold and dampness. Chicks reared on bottom-heat brooders are particularly subject to these troubles. Damp earth floors and cement floors in poultry houses produce it in older birds.

Give dry and comfortable quarters, feed little meat, plenty of green food, and soft feed seasoned with red pepper.

DIARRHŒA of chicks with clogging of the vent. Remove the hardened excre-

tion and anoint the parts. Chamomilla is useful in this complaint, a few drops in drinking water.

FROSTED COMB AND WATTLES.—As soon as discovered bathe with compound tincture of benzoin.

FOR LICE on perches, walls and coops, use kerosene or lime wash. To make the lime-wash more effective, pour a little crude carboic acid on the lime before slaking or mix with plenty of salt.

For use in nests, pour crude carboic acid on lime and allow it to air-slake. Put one or two handfuls of the carbolized lime dust in the nest box.

Pyrethrum powder kills by contact and is effective for dusting in nests, and through the feathers of birds. Its judicious use in the plumage and nests of sitting hens will insure immunity from lice for the hen and her young brood.

Chicks and poults are often killed by large lice, that congregate about the head, throat, vent and wings. To destroy them, soak fish berries in alcohol, take the birds from under the mothers at night and slightly moisten the down of the infested parts with the poison.

How to Preserve Eggs

Now that eggs are dearer as a rule than they have been for years, many people are inquiring about the methods of preserving them. The old way was to pack them in salt or lime. This served the purpose, but it gave the eggs a very strong taste.

The approved method now is the one which calls for the use of "water glass," or silicate of soda. This is a thick, syrupy liquid which can be had at most drug stores for about 10 cents a pound, and a pound is enough to treat five dozen eggs, so that the cost of preserving is about two cents a dozen.

There are several grades of water glass, and it is wise to get the best. To prepare the solution, stir one part of the silicate of soda into sixteen parts of water which has been boiled, cooled and carefully measured.

It is essential to have the eggs fresh, or the experiment will not be a great success. Those over three days old should not be used, as the air has already had a chance to penetrate them. The very best way is to keep the solution made up ready and put the eggs into it just as soon as they are brought in from the nests, if you have your own chickens.

It is worse than useless to try to preserve eggs that are not fresh or that have been cracked or washed.

Incubation and Gestation Tables

Chickens	20-22 days
Geese	28-34 days
Ducks	28 days
Turkeys	27-29 days
Guinea fowls.....	28 days
Pheasants	25 days
Ostriches	40-42 days

The period of gestation in animals varies considerably, but the following is an average period based on a long series of observations:

Elephant	2 years
Camel	11-12 months
Ass	12 months
Mare	11 months
Cow	9 months
Sheep	5 months
Goat	5 months
Pig	3½ months
Bitch	9 weeks
Cat	8 weeks
Rabbit	30 days
Guinea pig.....	65 days

Horse Ailments

(From the Biggle Horse Book)

The majority of horse ailments may be traced, directly or indirectly, to improper feeding and watering, careless management in the stable and in harness. A careless driver is a very frequent cause of loss.

There is no reason why a first-class team, six to eight years old, should not serve continuously and satisfactorily for a term of twelve to sixteen years, if properly protected, fed and looked out for.

If, from improper care or feeding, or from some unavoidable cause, your horse is out of condition, you should dose him with little medicine and much common sense.

The horse that allows himself to be caught lying down may be considered out of condition or lacking sufficient nutritious food. A quart of linseed meal divided into three feeds and added to his grain daily will do him much good and help a quick shedding of the coat.

BLINDNESS.—Consult a skilled veterinarian at once.

Bots.—The bot-fly resembles a honey-bee in size, and in late summer deposits eggs of a yellowish color on the hair of the horse's breast, legs, etc. In trying to bite at these eggs, the animal gets some of them in his mouth and throat. The eggs soon hatch and the larvæ attach themselves eventually to the lining of the stomach, and are then called "bots." They remain in the stomach until the following spring. Of course, the presence of these pests causes more or less irritation, but, as a rule, no serious harm is done in ordinary instances. Contrary to popular belief, bots do not eat holes through a horse's stomach. We do not know of any treatment that will remove bots. *Prevention* should be the horse owner's main reliance. Kill the flies whenever possible; hang pieces of red cloth from the halter throat-latch, so that the shaking of the head when a horse is in pasture may serve to frighten the flies away; and scrape off, from time to time, any eggs which are found on the horse.

BROKEN-WIND.—See Heaves.

CAPPED HOCK.—May be reduced in the same manner as Wind Galls (which see).

CHOKING.—Horses that choke thrust out their heads, bend and stretch the neck, while there is a copious flow of saliva from the mouth. In some cases

there is distention of the gullet on the left side of the neck, if it has descended so far. If it be in the upper part of the gullet a man accustomed to giving balls may be able to reach it with his hand. Obstructions that have got lower down may be moved upward gently from the outside. Sometimes an obstruction is soft and may be crushed small enough for the animal to swallow it. A mass of meal or other impacted food is sometimes removed by frequent drinks of water, and a drench of olive or cotton seed oil can do no harm. The plan of reaching a whip or heavy piece of rope down the gullet to push the substance into the stomach is risky, in the hands of one not accustomed to the anatomy of the horse.

CHOKING DISTEMPER.—This disease prevails at times in many parts of the country. It is sometimes called spinal meningitis or putrid sore throat. The animal often falls down paralyzed, cannot arise, and if left prostrate is almost sure to die. He must be got upon his feet, and if he cannot stand must be swung. A majority of cases are fatal. It is caused by some specific poison taken into the system with food or drink, mostly the former. Dirty mangers, rotting roots or meal, and mouldy hay, especially meadow hay, are usually the media by which the disease is acquired. The moral is to have everything sweet and clean that the animal eats and drinks, and have no decayed matter in the entry or in any other part of the barn. (See Distemper.)

COCKED ANKLE.—See Knuckling.

COFFIN-JOINT LAMENESS.—Same as Navicular Disease (which see).

COLIC, SPASMODIC.—This begins suddenly. The horse stamps impatiently, looks backward, soon paws, and then rolls. After an interval of ease the pains return with increased severity. Give chloral hydrate, one ounce, in half a pint of water as a drench; or ether and laudanum, two ounces each, in linseed oil, half a pint; or sulphuric ether and alcohol, two ounces of each in eight ounces of water. If nothing else is handy, give of whiskey half a pint in hot water. If not relieved in one hour repeat any of the doses prescribed. The body should be warmly clothed and sweating encouraged. Dip blankets in hot water containing a small quantity

of turpentine, and hold them in place under the body with dry blankets, or rub the abdomen with stimulants or mustard water. If cramp is due to irritation in the bowels, a cure is not complete until a physic of aloes, one ounce; or linseed oil, one pint, is given. Soapy or salt water aids the cure when used as an injection.

COLIC, WIND.—Is caused by feeding after a long fasting, or when the animal is exhausted by driving, or by new grain or hay, too much grain fed, or by sour or indigestible food. The horse seems dull, paws, and the pains are continuous. The belly enlarges, and when struck in front of the haunches sounds like a drum. If not soon relieved, difficult breathing, sweating, staggering and death follow. Give alkalines to neutralize the gases formed. No simple remedy is better than common baking soda, two to four ounces. If this fails, give chloride of lime in half-ounce doses, or the same quantity of carbonate of ammonia dissolved and diluted with oil or milk, until relieved. Chloral hydrate is particularly useful in both wind and spasmodic colic. Horsemen would be wise to keep it ready for emergencies. Physic should be given in flatulent colic, and turpentine, one to two ounces, with linseed oil, eight ounces, frequently, to stimulate the motion of the bowels. Colic should not be neglected nor the patient left, until you are certain of cure or death.

COUGH.—If a horse coughs, dampen his hay, wet his mixed feed, keep him out of a draught; after exercise blanket him. (See Heaves.)

CRIBBING OR WIND-SUCKING.—This is a bad habit, rather than a disease. The horse bites his manger or other convenient object, sucks air and makes a peculiar grunting noise. Prevention aids a cure. Iron mangers and stable fittings are a great help; or box stalls containing no projecting wooden objects.

CURB.—A curved, unnatural condition of the back part of the hock. Lameness, enlargement and more or less inflammation are symptoms. Liniments, iodine ointment, blisters, and, as a last resort, firing, are all recommended.

DISTEMPER.—Keep hot poultices of bread and milk or oil meal on the neck of horses with throat distemper; change them often. In severe cases, rub the glands and muscles with spirits of turpentine and camphor. (See Choking Distemper.)

DYSENTERY.—If this trouble exists, place the horse in a dry, well-ventilated stable, rub the surface of the body frequently, and keep it and the legs warm with blankets and bandages. The food must be light and easy to digest, the water pure and in small quantities. Give first, castor oil, one-half pint, and laudanum, two ounces. The strength must be kept up by milk punches, eggs, beef tea, oatmeal gruel, etc.

EYE.—See Hooks, Pink-Eye and Blindness.

FARCY.—A form of glanders which attacks the skin. (See Glanders.)

FETLOCK.—If this be sprained and the injury slight, bandage and apply cold water frequently. Where the lameness is intense, and the swelling and heat great, the leg should be kept in a constant stream of cold water. When the inflammation has been subdued, the joint should be blistered. (See Knuckling.)

FITS.—See Staggers.

FOUNDER.—The front feet are usually affected, the delicate laminae being inflamed. Acute founder, if not cured, develops into chronic founder, and no sure cure is known for the latter stage of the disease. The trouble may come from any one of several causes: Long or hard driving, hard pavements or roads, feeding or watering a horse while he is exceedingly warm or tired, etc., etc. Lameness, pain and heat in the fore feet, are common symptoms. For an attack of this kind, the best things to do are about as follows: Get the shoes off, put the horse in his stall, and soak or pack his feet in cold water, moss, or whatever is handy; give a tablespoonful of saltpeter as a drench three times a day; send for a veterinarian.

GALLS.—See Shoulder and Wind Galls.

GIDDINESS.—A horse which is frequently or occasionally overtaken with this trouble is dangerous to use. It is hard to cure. It indicates the need of moderate driving, especially in hot weather, and that a small amount of hay should be fed.

GLANDERS.—Whenever a horse is seen to bleed or emit offensive matter from the nostrils, glanders may be suspected and home treatment should not be attempted. It may be a dangerous case, which is fatal alike to man and beast. A veterinary surgeon should be called.

GORGED STOMACH.—This results when a horse has been fed after a long fast. The small stomach of a horse is so dis-

tended that it is unable to contract itself upon its contents, a motion which is necessary in digestion. The horse becomes stupid, slight colicky symptoms are observed, and he carries his head low and extended. As he grows worse he paws, becomes delirious, is covered with cold sweat, trembles, slobbers, staggers and drops dead. Treatment is difficult. A purgative of Barbadoes aloes, one ounce, should be given at once, followed by Cayenne pepper, one-half ounce, or Jamaica ginger, one-half ounce. If the bowels can be stimulated to act, they will in a measure relieve the stomach. For this purpose, use turpentine, two ounces, and linseed oil, eight ounces.

GREASE HEEL.—See Scratches.

HEAVES.—A peculiar movement of the abdomen and flank, points to heaves; a cough usually accompanies it. There is no cure for the established disease. Careful dieting will relieve the distress, but this will appear as bad as ever when the stomach is overloaded. The best quality of food lessens heaves. Food that is too bulky and which lacks nutriment, has much to do with the disease. Feed affected animals only a small quantity of hay once a day, and invariably water at least fifteen minutes before feeding, and never directly after meal. Work right after eating aggravates the symptoms. Carrots, potatoes or turnips, chopped or mixed with oats or corn, are a good diet. What bulky food is given should be in the evening. Medical treatment is worth less than dieting. A predisposition to the disease may be inherited.

HIDEBOUND.—A symptom, not a disease. The trouble comes because the horse is out of condition, or because he has worms, bad teeth, indigestion, or some chronic disease.

HOCK.—See Capped Hock, etc.

HOOKS.—There is a widespread delusion that hooks, so called, is a disease affecting the horse's eye. A barbarous custom among cruel men is to forcibly destroy the membrane which keeps the eye free from foreign substances, but the cruelty does not accomplish the desired result, though it may injure or destroy the eye. The obstinacy of the membrane simply shows something to be wrong in the anatomy of the horse, just as the tongue will indicate to the observing physician when the stomach of his subject is out of order. To cut or disturb the hooks in the eyes is as

absurd as to doctor the tongue instead of the stomach in the human case.

INDIGESTION.—Some horses, although having a good appetite, remain gaunt and thin from indigestion. They should be given some strong purgative, like Barbadoes aloes, combined with powdered ginger, one-half ounce; Glauber's salts, one-half pound, dissolved in a quart of water. When the intestines have been thoroughly cleaned by this process, give daily the following powder: Sulphate of iron, three drachms; sulphate of soda, two ounces; nux vomica, ten grains; ginger, one-half ounce. This powder may be continued daily for a month. Give all the rock salt the animal will lick.

ITCHING SKIN.—Wash the skin thoroughly with carbolic soapsuds, and give the horse a half pound of Glauber's salts daily for a week. Do not feed him any grain but wheat, scalded bran and linseed meal, three quarts of the former and one quart of the latter, for two weeks. There will speedily come a change. Card him daily. Scald his oats and give him salt daily. Feed oats, bran and linseed after the two weeks and scald the whole mess. When horses are covered with bunches or lumps, their blood is out of order. Give doses of Glauber's salts daily and hot bran mash. Give salts a half pound daily. A gill of raw linseed oil every day will be good, mixed with the bran.

KNUCKLING OR COCKED ANKLE.—A condition of the fetlock joint which resembles partial dislocation. The trouble is not considered unsoundness, but it predisposes to stumbling. Foals are quite subject to it, and no treatment is necessary, as the legs straighten up naturally in a few weeks. It is caused in horses by heavy and fast work, and is produced sometimes by a disease of the suspensory ligament, or of the flexor tendons. This should be relieved by proper shoeing. The toe must be shortened and the heels left high, or the shoe should be thin forward with thick heels or high calks.

LAMENESS.—May be due to founder, navicular disease, faulty shoeing, sprains, spavin, etc., etc.

LAMINITIS OR FOUNDER.—See Founder,

LAMPAS.—Usually an imaginary trouble. Very rarely does the membrane directly beneath the upper front teeth congest and swell enough to interfere with feeding. When this trouble is feared there is no quicker nor surer

cure than feeding a little corn in the ear. When biting off the kernels, the horse naturally compresses the membrane or forces it back. The burning of the lampas is cruel and unnecessary, and if the swelled parts are cut, the cut should not be deep, or danger will result.

LICE.—Remove these by rubbing the horse with a solution of sulphate of potassium, four ounces, and water, one gallon; or with strong tar water; or dust with Persian insect powder; or the skin may be sponged with benzine or quassia chip tea. Any of the applications must be repeated a week later to destroy the lice hatching in the interval. All blankets should be boiled, and the stalls painted with turpentine, and littered with fresh pine sawdust.

LOCKJAW.—This is caused by cuts, nail in the hoof, etc. Nothing is so common from wounds in the feet and from docking. The horse is unable to open his jaws to the fullest extent, and mastication is impossible. Various muscles twitch, the head and tail are elevated and the nose protruded, and the anus is compressed. The animal swallows with difficulty; saliva flows from the mouth. Of course, in this disease the necessity of calling in a skilled veterinary surgeon is indicated.

MEGRIMS.—See Giddiness.

MENINGITIS SPINAL.—See Choking Distemper.

OVERWORK, OVERHEATING, ETC.—An experienced horseman, if humane, will not push his horse beyond his strength. An indiscreet driver will sometimes bring an animal to the verge of extinction. The symptoms are plain in the audible breathing, staggering gait, exhausted appearance and heaving flank. The girths must be removed and the face turned toward the wind, the animal being protected from the sun meantime. The head must be left free and the limbs and body well rubbed. The movement of the ribs should not be hindered in any way. A few swallows of cold water may be allowed, and, in hot weather, the mouth, forehead and face may be sponged with it. When sufficiently revived, the horse should be slowly led to a comfortable box-stall and heavily blanketed, woolen bandages being wound about the legs as well. If the horse has fallen he must not be allowed to lie until he voluntarily gets up, but must be propped up on his breast and not allowed to lie flat on his side. Heat exhaustion is somewhat

similar in symptom and demands similar treatment, with the addition, of throwing cold water over the animal, particularly wetting the head, and causing a current of air to pass over him that evaporation may take place.

PINK-EYE.—A species of influenza which causes inflammation of the eye. It is contagious. Isolate the patient; disinfect his old stall; blanket him and feed him warm mash and laxative food; bathe the eyes occasionally with hot water. Boric acid (one dram diluted with three ounces of water) makes an excellent solution for dropping into sore eyes, at intervals of three or four hours.

RING BONE.—An osseous exudation or bony deposit at the crown of the hoof. When its presence is first detected the place should be severely blistered once or twice, or red iodide of mercury applied. If this fail, firing with the hot iron in the hands of a competent surgeon will be necessary.

ROARING.—A disease of the muscles of the larynx and a vocal cord. Causes a roaring or whistling sound when the horse is exercising. This trouble may come from straining the respiratory organs, it may be an after-effect of distemper, or it may have been inherited. Treatment is of little benefit, although a surgical operation sometimes brings relief.

SCRATCHES OR GREASE HEEL.—This trouble is frequently the result of carelessness in cleaning and ventilating the stable. Many a horse is ruined by allowing the legs to go dirty. It takes only a few minutes to wash them clean and rub them dry. If the skin begins to crack it must not be left or it will become almost incurable. The skin must be kept clean and soft. The disease may result from the condition of the blood, from unwholesome fodder, or work in irritating mud or dust, especially of a limestone character. It has been brought on by using caustic soap on the legs, clipping the heels in winter time, by debilitating disease, etc. The first step in a cure is to remove the cause, and if there is much local heat, administer a laxative, like a pound of Glauber's salts. Highly-fed animals should have their rations reduced, or replaced by bran mash, flaxseed, fruits, roots, and other non-stimulating food. Bitter tonics are essential also, and may be continued six weeks to two months. If the skin is unbroken, bathe with

water, one quart, in which sugar of lead, two drachms, is dissolved; or anoint with vaseline, one ounce, sugar of lead, one drachm, and carbolic acid, ten drops. To clip the hair from the horse's heels and poultice them with grated carrot, night and morning, is sometimes beneficial. Free exercise is important. Rub the heels dry and apply equal parts of glycerine and compound tincture of aloes. Or try this: Cut the hair off short and paint it over with chloride of zinc and water—thirty grains to one pint of water. Put this on once a day and rub with glycerine.

SHOULDER.—Have properly fitting collars. If the surface galls under the collar, wash with salt and water at night and with clear water in the morning, and protect the spot with a pad under the collar. If the skin breaks, use a lotion of one drachm of carbolic acid to one quart of water twice a day, and relieve the horse from work for a day or two. It is cruel to work a horse with a raw, sore shoulder. Various forms of shoulder lameness exist. (See Sweeny, Navicular Disease, etc.)

SKIN.—See Itching Skin.

SPAVIN.—If you have a suspicion of a spavin coming on your horse, employ a good veterinary surgeon. Heroic treatment is the only thing in such cases. Judicious firing, strong blistering and perfect rest for at least six weeks or two months, and good nursing will, in most cases, arrest the disease and cure lameness. It is the result of too great exposure in draught or speed, or from slipping and kindred causes.

SPINAL MENINGITIS.—See Choking Distemper.

SPLINT.—This may be rubbed off and the work aided by putting on a liniment, but few would persevere in the rubbing long enough to make a cure. A blister will do it.

SPRAINS.—See Fetlock, etc.

STAGGERS OR FITS.—Horses liable to this trouble should have harnesses that are carefully adjusted, and should not be pushed in hot weather. No heavy feed should be given them at any time, oats and sweet hay or grass being the best. Such animals should not be driven when it can be avoided. When indications point to an attack, the horse should be stopped, his harness loosened, some cold water given him to drink and his face sponged at the same time. Rye is a bad feed for sleepy staggers.

STRING HALT.—Cures are difficult and rare. Consult a veterinarian.

SUNSTROKE.—See Overheating.

SWEENY.—This is often called shoulder lameness, and it causes the wasting away of some muscles on the outside of the shoulder blade. The trouble, as a rule, is brought about by extra-hard work or pulling when a horse is young. More or less lameness is a symptom of sweeny. Easy work; perfect-fitting collars; rubbing with liniment; light blisters, etc., are recommended, but a cure is difficult and tedious, as a general thing.

TEETH.—A twenty-year-old horse was not doing well. Upon examination his front teeth were found to be so long that his grinders were kept from coming together, and he could not masticate his food. His teeth were filed off, and the sharp points evened with a float, and he is now doing as well as any of the younger horses. Watch the teeth of the old horse. (See Lampas.)

THOROUGH-PIN.—An enlargement between the point of the hock and the front of the hock joint. Treatment should be the same as for wind-puff.

UNNATURAL APPETITES.—The horse which eats its own excrement, dirt, etc., does it for the acids and salts found in such substances. Give such a horse a *pinch* of copperas, bone dust, salt, ashes and saltpetre mixed in its meal once a day. A few days of pasturing will prove beneficial.

WHEEZING.—Horses often snort and wheeze because of an enlargement of the glands in the nostrils. A skilled veterinarian can remove the trouble by cutting it out. Doctoring will not cure snoring or wheezing horses. The air passages are stopped. Wheezing may also be caused by a form of asthma called Heaves (which see).

WIND GALLS OR PUFFS.—The treatment consists in pressure by means of bandages and by cold lotions; also, hand rubbing and iodine ointment.

WIND-SUCKING.—See Cribbing.

WORMS.—Horses having greedy appetites, rough coats and poor condition may be suspected of worms. Such animals often pass long, round worms. Copperas or tobacco will clear the worms out of the stomach of a horse. A tablespoonful of copperas for two days and then stop for two. A handful of tobacco dried and made into powder and mixed with the grain. Give this for

three days and then omit it for a few days. For worms in the rectum a syringe must be used. Salt and water are good; or, carbolic acid diluted fifty times in water; or, what is better, thymo-cresol, diluted one to fifty parts of water.

PUNCTURE.—It is dangerous for a horse to step on a nail, as it is likely to result in lockjaw. Have the blacksmith cut out the puncture down to tender flesh, then fill the opening with a 5 per cent. solution of carbolic acid and pack with cotton to keep out dirt, and repeat daily, soaking the foot in clean warm water before dressing.

NAVICULAR DISEASE is indicated by a shrunk shoulder, and a contracted foot that is placed several inches in advance of the other while at rest. This is an inflammation or ulceration of the pedal sesamoid at the point where the tendons play over it. The symptoms are often very obscure, according to the stage of the disease, and the lameness is attributed to some difficulty in the shoulder. This, however, is a mistake. It is due to, the wasting of the shoulder muscles from disease. The cause is usually fast work on hard roads or pavements, causing slight inflammation, which being unnoticed or neglected, increases and ends in ulceration. The best treatment is to remove the shoe, pare down the hoofwall and round the edge to prevent splitting, then fire deeply in points around and above the coronet, follow up with one or more blisters of red iodide of mercury, one part, lard, three parts, and when the effects pass off, turn out the animal to pasture for six weeks. It is always best to consult, in this disease, a competent veterinary surgeon.

CORNS originate in simple bruises. There is later an increased production

of hoof, and the formation of a horny tumor which presses on the quick. If of recent formation apply a bar shoe and rasp down the bearing surface of the afflicted heel and avoid pressure. Soak the feet. A horny tumor must be pared to the quick and packed with tar. Shoe with a bar shoe and place a leather sole between it and the hoof. If the corn be further advanced the foot should be soaked in a bucket of hot water for an hour, and then poulticed. Any matter that has formed should be liberated, and if grit or dirt has got into the heel this should be cleaned out. Poultices should be kept upon the wound until it is healed and free from soreness. If the cause is so serious that matter has burst out at the top of the heel, only a veterinary surgeon is competent to manage it.

THRUSH is a disease which shows an excessive secretion of unhealthy matter in the frog, and is detected by its vile odor. A common cause is foul stables. The cure consists in cleanliness and the removal of the cause. The diseased and ragged portions of the frog should be pared and scraped and the foot poulticed for a day or two with oil meal and water, to which may be added a few drops of carbolic acid, or some powdered charcoal. The dressing should be changed daily, and after every vestige of decayed substance is removed, the cleft of the frog and grooves on its edges should be cleaned and packed with oakum, held in place by leather nailed on with the shoe. Before packing, cover the place with a good coat of sulphate of zinc, pressing well in. Horses especially liable to thrush may need to be protected in the stable by the use of boots. Sometimes other diseases combine with thrush, making a cure seem impossible.

Dehorning Calves

Taking horns off yearling or older cattle is a hard shock to them. It costs a week's feed, and may cost much more. It is very easy to prevent the horns starting, requiring only thoughtful attention for a few minutes before the horns have come through the skin.

The following recipe has never failed: Procure common powdered concentrated lye, such as all housewives use. A 10-cent can will dehorn 100 calves. When the calf is a week or more old, before the horn has come through the skin, and when you can feel it in the shape of a little button under the skin, take

the calf in hand. Lay him gently on his side. Spit on the little bump and rub it in with your finger, till a place is wet as big as a silver quarter of a dollar. Don't wet anywhere else. Take your knife and lift out dry the powdered lye, as much as two grains of corn. Press it down on the wet place. It will stick there. Treat the other side in the same manner. Let the calf go. It won't hurt him much, or long. A scab forms; do not touch it. It will peel off after a time, and the hair will grow over the place; you will have a fine, smooth head, equal to a natural polled head.

NOTE.—Planting time varies according to season and locality; dates given above are only approximate, and are based on latitude of Pennsylvania; allow about five days difference for each 100 miles north or south of this State. Do not work soil in spring while it is very wet and soggy; wait. Plants set in autumn must be well mulched with strawy manure, leaves, etc., during first winter. Successional sowings of corn, peas, etc., may be made later than the dates given.

INGHAM COUNTY

SPRAYING CALENDAR

PLANT	FIRST APPLICATION	SECOND APPLICATION
APPLE (<i>Scab, rot, rust, codling moth, bud moth, tent caterpillar, canker worm, curculio, etc.</i>)	When buds are swelling, but before they open, Bordeaux.	If canker worms are abundant just before blossoms open, Bordeaux-arsenical mixture.
ASPARAGUS (<i>Rust, beetles.</i>)	Cut off all shoots below surface regularly until about July 1st.	After cutting ceases, let the shoots grow and spray them with Bordeaux-arsenical mixture.
BEAN (<i>Anthraxnose, leaf blight, weevil, etc.</i>)	Treat the seed before planting with bisulphide of carbon. (See remarks.) When third leaf expands, Bordeaux.	10 days later, Bordeaux.
CABBAGE (<i>Worms, lice, maggots, etc.</i>)	Pyrethrum or insect powder.	7-10 days later, repeat.
CELERY (<i>Blight, rot, leaf spot, rust, caterpillars.</i>)	Half strength Bordeaux on young plants in hotbed or seedbed.	Bordeaux, after plants are transplanted to field. (Pyrethrum for caterpillars if necessary.)
CHERRY (<i>Rot, aphid, slug, curculio, black knot, leaf blight, or spot, etc.</i>)	As buds are breaking, Bordeaux; when aphid appear, tobacco solution or kerosene emulsion.	When blossoms drop, Bordeaux-arsenical mixture.
CURRENT GOOSEBERRY (<i>Worms, leaf blight.</i>)	At first appearance of worms, hellebore.	10 days later, hellebore. Bordeaux if leaf blight is feared.
GRAPE (<i>Fungous diseases, Rose bugs, lice, flea, beetle, leaf hopper, etc.</i>)	In spring, when buds swell, Bordeaux.	Just before flowers unfold, Bordeaux-arsenical mixture.
MELONS CUCUMBERS (<i>Mildew, rot, blight, striped bugs, lice, flea beetle, etc.</i>)	Bordeaux, when vines begin to run.	10-14 days repeat. (Note: Always use half strength Bordeaux on watermelon vines.)
PEACH (<i>Rot, mildew, leaf curl, curculio, etc.</i>)	As the buds swell, Bordeaux.	When fruit has set, repeat. Jar trees for curculio.
PEAR AND QUINCE (<i>Leaf blight, scab, psylla, codling moth, blister mite, slugs, etc.</i>)	As buds are swelling, Bordeaux.	Just before blossoms open, Bordeaux. Kerosene emulsion: when leaves open for psylla, if needed.
PLUM (<i>Curculio, black knot, leaf blight, brown rot, etc.</i>)	When buds are swelling, Bordeaux.	When blossoms have fallen, Bordeaux-arsenical mixture. Begin to jar trees for curculio.
POTATO (<i>Flea beetle, Colorado beetle, blight rot, etc.</i>)	Spray with Paris green and Bordeaux when about 4 in. high.	Repeat before insects become numerous.
TOMATO (<i>Rot, blight, etc.</i>)	When plants are 6 in. high, Bordeaux.	Repeat in 10-14 days. (Fruit can be wiped if disfigured by Bordeaux.)

NOTE.—For San Jose scale on trees and shrubs, spray with the lime-sulphur mixture in autumn after leaves fall, or (preferably) in early spring, before buds start. The lime-sulphur

SPRAYING CALENDAR

THIRD APPLICATION.	FOURTH APPLICATION.	REMARKS.
When blossoms have fallen. Bordeaux-arsenical mixture.	8-12 days later, Bordeaux - arsenical mixture.	For aphid (lice) use one of the lice remedies mentioned elsewhere. Dig out borers from tree trunks with knife and wire. For oyster-shell scale, use whale-oil soap spray in June.
2-3 weeks later, Bordeaux-arsenical mixture.	Repeat in 2-3 weeks.	Mow vines close to ground when they are killed by frost, burn them, and apply a mulch of stable manure.
14 days later, Bordeaux.	14 days later, Bordeaux.	For weevils: Put seed in tight box, put a cloth over seed, pour bisulphide of carbon on it, put lid on and keep closed for 48 hours. Use 1 oz. to 4 bus. of seed.
7-10 days later, repeat.	Repeat every 10-14 days until crop is gathered.	Root maggots: Pour carbolic acid emulsion around stem of plants. Club root: Rotate crops; apply lime to soil; burn refuse; treat seed with formalin before planting.
14 days later, repeat.	14 days later, repeat.	Rot or rust is often caused by hilling up with earth in hot weather. Use boards for summer crop. Pithy stalks are due to poor seed; or lack of moisture.
10-14 days, Bordeaux.	Hellebore, if a second brood of slugs appear.	Black knot: Dark fungous-looking bunches or knots on limbs. Cut off and burn whenever seen.
10-14 days, repeat, if necessary.	2 to 4 weeks later, repeat.	Cane-borers may be kept in check by cutting out and burning infested canes.
When fruit has set, Bordeaux - arsenical mixture.	2 to 4 weeks later, Bordeaux.	For lice, use any of the lice remedies. For rose bugs, use 10 pounds of arsenate of lead and one gallon of molasses in 50 gallons of water, as a spray. Or knock the bugs into pans of kerosene every day.
10-14 days, repeat.	10-14 days, repeat.	Use lice remedies for lice. For striped bugs, protect young plants with a cover of mosquito netting over each hill. Or keep vines well dusted with a mixture of air-slaked lime, tobacco dust and a little Paris green.
When fruit is one-half grown, Bordeaux.	NOTE:—It is safer always to use half-strength Bordeaux on peach foliage.	Dig out borers. Cut down and burn trees affected with "yellows."
After blossoms have fallen. Bordeaux-arsenical mixture.	8-12 days later, repeat.	Look out for "fire blight." Cut out and burn blighted branches whenever seen.
10-14 days later, repeat.	10-20 days later, Bordeaux.	Cut out black knot whenever seen.
Repeat for blight, rot and insects.	Repeat.	To prevent scabby tubers, treat the seed with formalin before planting.
Repeat in 10-14 days.		Hand-pick tomato worms.

mixture is a fungicide as well as a scale cure, and if it is used the first early Bordeaux spray may be omitted.

FARMERS' BULLETINS

Sent Free to Residents of the United States, by Department of Agriculture
Washington, D. C., on Application.

NOTE.—Some numbers omitted are no longer published. Bulletins in this list will be sent free, so long as the supply lasts, to any resident of the United States, on application to his *Senator, Representative, or Delegate in Congress*, or to the Secretary of Agriculture, Washington, D. C. Because of the limited supply, applicants are urged to select only a few numbers, choosing those which are of special interest to them. Residents of foreign countries should apply to the Superintendent of Documents, Government Printing Office, Washington, D. C., who has these bulletins for sale. Price, 5 cents each to Canada, Cuba, and Mexico; 6 cents to other foreign countries.

SPRAYING FORMULAS

FUNGICIDES.—Bordeaux mixture is made by taking three pounds of sulphate of copper, four pounds of quicklime, fifty gallons of water. To dissolve the copper sulphate, put it into a coarse cloth bag and suspend the bag in a receptacle partly filled with water. Next, slake the lime in a tub, and strain the milk of lime thus obtained into another receptacle. Now get some one to help you, and with buckets, *simultaneously* pour the two liquids into the spraying barrel or tank. Lastly, add sufficient water to make fifty gallons. It is safe to use this full-strength Bordeaux on almost all foliage—except, perhaps, on extra tender things, such as watermelon vines, peach trees, etc. For these it is wiser to use a half-strength mixture.

FORMALIN.—This is also called formaldehyde, and may be purchased at drug stores. Its principal use is to treat seed potatoes to prevent "scab." Soak the whole seed for two hours in a mixture of one-half pint formalin and fifteen gallons of cold water; dry the seed, cut, and plant in ground that has not recently grown potatoes.

BORDEAUX COMBINED WITH INSECT POISON.—By adding one-quarter pound of Paris green to each fifty gallons of Bordeaux, the mixture becomes a combined fungicide and insecticide. Or, instead of Paris green, add about two pounds of arsenate of lead. The advantages of arsenate of lead over Paris green are, first, it is not apt to burn foliage even if used in rather excessive quantities; and, second, it "sticks" to the foliage, etc., better and longer.

INSECTICIDES.—ARSENATE OF LEAD.—This is the best insecticide for chewing insects, and is for sale by seedsmen. Use about two pounds in fifty gallons of water.

WHITE HELLEBORE.—This, if fresh,

may be used instead of Paris green in some cases—worms on currant and gooseberry bushes, for instance. (It is not such a powerful poison as the arsenites, and would not do so well for tough insects such as potato-bugs.) Steep two ounces in one gallon of hot water, and use as a spray.

FOR SUCKING INSECTS.—Now we come to another class of insecticides, suited to insects which suck a plant's juice but do not chew. Arsenic will not kill such pests; therefore we must resort to solutions which kill by *contact*.

KEROSENE EMULSION.—One-half pound of hard or one quart of soft soap; kerosene, two gallons; boiling soft water, one gallon. If hard soap is used, slice it fine and dissolve it in water by boiling; add the boiling solution (away from the fire) to the kerosene, and stir or violently churn for from five to eight minutes, until the mixture assumes a creamy consistency. If a spray pump is at hand, pump the mixture back upon itself with considerable force for about five minutes. Keep this as a stock. *It must be further diluted with water before using.* One part of emulsion to fifteen parts of water, is about right for lice.

CARBOLIC ACID EMULSION.—Made by dissolving one pound of hard soap or one quart of soft soap in a gallon of boiling water, to which one pint of *crude* carbolic acid is added, the whole being stirred into an emulsion. One part of this is added to about thirty-five parts of water and poured around the bases of the plants, about four ounces per plant at each application, beginning when the plants are set out and repeated every week or ten days until the last of May. Used to fight maggots.

WHALE-OIL SOAP SOLUTION.—Dissolve one pound of whale-oil soap in a gallon

of hot water, and dilute with about six gallons of cold water. This is a good application for aphids (lice) on trees or plants. For oyster-shell or scurvy scale use this spray in May or June or when the tiny scale lice are moving about on the bark.

TOBACCO TEA.—Place five pounds of tobacco stems in a water-tight vessel, and cover them with three gallons of hot water. Allow to stand several hours; dilute the liquor by adding about seven gallons of water. Strain and apply. Good for lice.

LIME-SULPHUR MIXTURE.—Slake twenty-two pounds of fresh lump lime in the vessel in which the mixture is to be boiled, using only enough water to cover the lime. Add seventeen pounds of sulphur (flowers or powdered), having previously mixed it in a paste with water. Then boil the mixture for about an hour in about ten gallons of water, using an iron but not a copper vessel. Next add enough more water to make, in all, fifty gallons. Strain through wire sieve or netting, and apply while mixture is still warm. A good, high-pressure pump is essential to satisfactory work. Coat every particle of the tree. This is the standard San Jose scale remedy, although some orchardists prefer to use the soluble oil sprays now on the market.

PYRETHRUM, OR PERSIAN INSECT POWDER.—It may be dusted on with a powder bellows when the plants are wet; or one ounce of it may be steeped in one gallon of hot water, and sprayed on the plants at any time. It is often used on flowers, in greenhouses, on vegetables, etc.

BISULPHIDE OF CARBON.—This is used to kill weevils in beans and peas, etc. It comes in liquid form and may be had of druggists. When exposed to the air it quickly vaporizes into a poisonous and explosive gas which is heavier than air and which will destroy all insect life. (Caution.—Do not inhale the vapor, and allow no lights near.)

Tobacco stems, tobacco dust, kainit, soot, freshly-slaked lime, dust, etc., are often used as insect *preventives*—in the soil around plants to keep away grubs, worms and maggots, or dusted on to discourage the visits of cucumber bugs, etc. (Note.—The first four are excellent fertilizers as well as insect preventives.)

Crows and blackbirds frequently pull up planted corn. The best preventive is to tar the seed, as follows: Put the seed into a pail and pour on enough warm water to cover it. Add a teaspoonful of coal-tar to a peck, and stir well. Throw the seed out on a sieve or in a basket to drain, and then stir in a few handfuls of land plaster (gypsum), or air-slaked lime.

A NEW FUNGICIDE.—Some orchardists are now using the following self-boiled lime-sulphur spray, instead of Bordeaux, claiming that it is less liable to spot or burn fruit and foliage: Put eight pounds of unslaked lump lime in a barrel; add enough water to cover. When the lime begins to heat, throw in eight pounds of flowers of sulphur. Constantly stir and gradually pour on more water until the lime is all slaked; then add the rest of the water to cool the mixture. About fifty gallons of water, in all, are required. Strain. Two pounds of arsenate of lead may be added, if desired, to the finished mixture, which then becomes a combined fungicide and insecticide, and may be used in the same manner as advised for Bordeaux-arsenate of lead. (Special note.—The self-boiled mixture is *not* the same as the lime-sulphur advised for San Jose scale, which is too strong for trees in foliage.)

If you do not care to bother with making spraying mixtures at home, they can be purchased, already prepared, of seedsmen. For only a few trees or plants, the extra cost of these factory mixtures is not great.

Concrete

Concrete is made by mixing together Portland cement, sand and stone (or gravel). Various proportions of each are used, depending upon the use to which the concrete is put. About half an hour after mixing these materials together, the mass begins to stiffen, until, in from half a day to a day, it becomes so hard that you cannot dent it with the hand. By a month the mass is hard as stone—indeed, harder than most stones. The best way to buy cement is in cloth sacks. Manufacturers charge more for cement in cloth sacks, but allow a rebate for the return of the empty sacks. A bag of cement weighs 95 pounds, and four such bags make a barrel of 380 pounds.

It is important that your stock of cement be kept in a dry place. Once wet, it becomes hard and lumpy, and in such condition is useless. If, however, the lumps are caused by pressure in the storehouse, the cement may be used with safety. Lumps thus formed can be easily broken by a blow from the back of a shovel.

In storing cement, throw wooden blocks on the floor. Place boards over them and pile the cement on the boards, covering the pile with a canvas or a piece of roofing paper. Never, under any circumstances, keep cement on the bare ground, or pile it directly against the outside walls of the building.

Do not use very fine sand. If there is a large quantity of fine sand handy, obtain a coarse sand and mix the two sands together in equal parts; this mixture is as good as coarse sand alone.

Sometimes fine sand must be used, because no other can be obtained; but in such an event an additional amount of cement must be used—sometimes as much as double the amount ordinarily required. For example, in such a case, instead of using a concrete 1 part cement, $2\frac{1}{2}$ parts sand and 5 parts stone, use a concrete 1 part cement, $1\frac{1}{4}$ parts sand and $2\frac{1}{2}$ parts stone.

Besides being coarse, the sand should be clean. The presence of dirt in the sand is easily ascertained by rubbing a little in the palm of the hand. If a little is emptied into a pail of water, the presence of dirt will be shown by the discoloration of the water. This can be discovered also by filling a fruit jar to the depth of 4 inches with sand and then adding water until it is within

an inch of the top. After the jar has been well shaken, the contents should be allowed to settle for a couple of hours. The sand will sink to the bottom, but the mud, which can be easily recognized by its color, will form a distinct layer on top of the sand, and above both will be a clear depth of water. If the layer of mud is more than one-half inch in thickness, the sand should not be used unless it is first washed.

To wash sand build a loose board platform from 10 to 15 feet long, with one end a foot higher than the other. On the lower end and on the sides nail a board 2 by 6 inches on edge to hold the sand. Spread the sand over this platform in a layer three or four inches thick, and wash it with a hose. The washing should be started at the high end and the water allowed to run through the sand and over the 2-by-6-inch piece at the bottom. A small quantity of clay or loam does not injure the sand, but any amount over 5 per cent. does.

Great care should be used in the selection of the stone or gravel. The pebbles should be closely inspected to see that there is no clay on their surface. A layer of such clay prevents the "binding" of the cement. If necessary, stone or gravel may be washed in the same way as above described for sand. Dust may be left in the crushed stone without fear of its interfering with the strength of the cement, but care should be taken to see that such dust is distributed evenly through the whole mass, and when dust is found in stone, slightly less sand should be used than ordinarily. As to the size of stone or gravel, this must be determined by the form of construction contemplated. For foundations or any large thick structure, use anything from $\frac{1}{2}$ to $2\frac{1}{2}$ inches in diameter. For thin walls use $\frac{1}{4}$ to 1-inch stone. The best results are obtained by the use of a mixture of sizes graded from small to large. By this means the spaces between the stones or pebbles are reduced and a more compact concrete is obtained. Moreover, this method makes it possible to get along with less sand and less cement.

Water for concrete should be clean and free from strong acids and alkalis. It may be readily stored in a barrel

beside the mixing board and placed on the concrete with a bucket.

If you are at all in doubt about the purity of the water that you contemplate using, it would be well to make up a block of concrete as a test, and see whether the cement "sets" properly.

For ordinary work a very satisfactory concrete mixture is 1 part of Portland cement, $2\frac{1}{2}$ parts of clean sharp sand, 5 parts of broken stone. In heavy foundation work, the quantity of cement can be considerably less. The important thing is to have the sand and cement thoroughly mixed, and to use only clean sand. Use only as much water as necessary. It is not well to work concrete in freezing weather.

Cold Storage Without Ice

Why not have a cold storage room somewhere on the farm? Winter apples may be kept in such a place until spring, thus avoiding the necessity of marketing the fruit at unprofitable times. A Pennsylvania farmer has such a place built in one part of his barn—a double-walled, double-doored, paper-lined space wherein he stores many hundred bushel crates of selected fruit. He says that the main essentials are to keep out heat and frost from the room. On cool nights he leaves the doors open, shutting them again when the sun begins to warm things up in the morning—the idea being to use cold air instead of ice for reducing the room's temperature. He aims to get the temperature in the room as low as possible without freezing the apples, and then hold it there. Night air is cheaper than ice, he says, and about as good.

How to Make and Use a Fireless Cooker

A saver of time, fuel and labor is the fireless cook stove, which can be made at home, absolutely without expense, and, though not adapted to all kinds of cooking, answers well for food that requires long, slow cooking to soften tissues, bring out flavors and conserve the juices, such as stews, pot roasts, soups, cereals, rice, tapioca, dried fruits, vegetables, etc. It consists of a kettle of agate or tin, inclosed in a box with insulating material between them to prevent the heat of the kettle from escaping. Food brought to the boiling point over a fire, and inclosed, still boiling, continues to cook. This is the whole

principle. Choose a kettle with tight-fitting lid and a box large enough to allow six or eight inches of insulating material. Line the box, bottom, sides and hinged-on lid with stout packing paper, or several thicknesses of newspaper. Make a firm, cylindrical shape to fit easily around the kettle and fasten a circular bottom to it. This might be of asbestos paper, or paper soaked in alum water and dried. Then no matter how hot the kettle there would be no danger of scorching. Fill the bottom of the box with packing, which can be of cotton, wool, ground cork (in which imported grapes are packed and which grocers are usually willing to give away). Hay will answer, but does not pack so closely as these. Pack hard to a depth of three inches, place the cylinder, containing the kettle in the middle, and pack tightly around it, even with the top. The insulating material can be covered neatly with cloth, or a thin board with a round hole in the middle. A thick cushion will insulate the space between this and the lid, which must be fastened down tightly. If desired to cook several things at once it is best to have two or three such cookers, as the box should not be opened after the food is put in, except to reheat. Some persons prefer using a sort of double boiler, the inner kettle, containing the food, being placed in a larger one, partly filled with hot water. In this case the water in both kettles must be actually boiling. An additional vegetable can be put in the outside kettle, or water kept hot in it for dishwashing.

Ready-made cookers can be bought, but are rather expensive. Some of these will also bake and roast by means of thick disks of concrete which must be made very hot on the stove, then put under and over the kettle containing the food. The idea might be applied to the home-made cooker by heating soapstone griddles. These might be heated at the same time with a large iron pot. The meat or chicken, which should be seasoned, can be put in a kettle, a hot disk put in the bottom of the pot, the kettle set on this; the other disk put on top, then put the lid on the pot and bury in the cooker. The pot, however, should be inclosed in asbestos paper to avoid possible ignition. It would be interesting for each housekeeper to experiment and invent improvements on the central idea. The time required for cooking vegetables varies according to their age and fresh-

ness, so only the approximate time necessary can be given. There is little danger of their being overdone, or at least injured by long cooking, and if underdone it is always possible to take out the kettle, reheat, and return to the cooker, or if needed quickly, to finish on the range.

It is not worth while to use the cooker for food that takes but a short time to cook, such as corn, spinach, young peas, asparagus, etc., since the water for these must be brought to the boil anyhow, they can as well be cooked on the stove. Do not place the kettle next the flame but always have a lid under it.

POTATOES

Five minutes over fire, an hour in the box. Potatoes must not be left overtime in box or they become watery.

RICE PUDDING

Mix together in the kettle $\frac{1}{2}$ a cupful of rice, a quart of milk, a tablespoonful of butter, $\frac{1}{2}$ a cupful of sugar, a little salt and grated nutmeg. Boil on stove five minutes, in cooker six hours.

BREAD PUDDING

Soak $\frac{1}{2}$ a pint of bread crumbs in a pint of milk, add a beaten egg, 2 tablespoonfuls of sugar and a pinch of salt. Beat with a spoon; heat on the stove till just short of boiling, stirring all the time. Put in the cooker an hour and serve with vanilla sauce.

CHICKEN FRICASSEE

Disjoint a chicken, roll in flour and brown in a little fat; as the pieces brown pack them in the kettle, and make some gravy in the skillet. Put this and a little water to cover the chicken. Boil twenty minutes, then put in cooker over night.

BOILED HAM

If wanted for 6 o'clock dinner, put ham weighing six pounds in kettle at 9 a. m. Cover with cold water and bring to a boil; boil briskly fifteen minutes. Put the lid on the kettle when it begins to boil and don't take it off till it is taken out of the hay box, in which it should be put while still boiling. At 2 o'clock take out, boil up again, put in a few cloves and 2 or 3 peppercorns. At 5.30 take out, skin, put in a pan, fat side up, stick in a few cloves, sprinkle slightly with sugar and plentifully with bread crumbs and bake in the oven till well done.

ONIONS

Of moderate size, boiled ten minutes on the range, should be tender after four hours in cooker.

STRING BEANS

Cut off the strings and slice down the middle; give five minutes over the fire, four hours in cooker.

CAULIFLOWER AND YOUNG CABBAGE

Five minutes over fire, five hours in cooker.

Cereals started over the fire at supper time and placed in the box should be ready for breakfast with just reheating. Half a cupful of cereal poured into three cupfuls of boiling water, with a teaspoonful of salt is about the proportion.

A fireless cooker can be used for things to be kept cold as well as hot. Ice cream, if frozen, then packed in a kettle with ice and sunk in the box will not melt, and butter if put in it cool and hard will keep in the same condition, as the air is practically excluded.

BOSTON BAKED BEANS

Soak 2 cupfuls of beans in cold water a whole day. At supper time drain, cover with fresh water, put over the fire and simmer slowly for half an hour; pour off the water, scrape a $\frac{1}{4}$ pound of salt pork, cut off a slice and push it down through the beans to the bottom of the pail; score the rest and put, rind side up, in middle of the beans. Mix a teaspoonful of salt, a tablespoonful each of sugar and molasses, just a dust of mustard, a half teaspoonful of baking soda and a cupful of boiling water. Add enough more water to come to the top of the beans. Cover, and boil ten minutes; then put in cooker. In the morning reheat for ten minutes, return to the box and about half past five in the afternoon take out, sprinkle a tablespoonful of sugar over the top, leave off the cover, put in hot oven for half an hour.

POT ROAST

Season the meat with salt and pepper, brown on all sides over a flame, and put in a stone jar, dry, no water whatever. Cover tightly. Put the jar in a kettle of hot water. Boil fifteen or twenty minutes. Place in a cooker for six hours. Even tough meat becomes tender and the juice at the bottom is very rich.

The Farmers' Wooden Stave Silo is as solid as the Rock of Gibraltar. It can't cave in. It can't blow down. As a structure it is just as staple and permanent as cement or tile and it don't cost nearly as much. And—you can buy the Farmers' Silo on time.

YOU CAN'T DRINK "AND MAKE GOOD"

No matter what your position in life—you can't get away with it. Nothing destroys the usefulness of a strong brain as quickly as alcohol. Science tells us that the man who drinks, whether much or little, thinks, sees, hears and acts one-seventh slower than the man who doesn't drink.

Get away from it. Write for free booklet describing the NEAL treatment. 3 to 5 days away from your work or business will put you where you were before taking your first drink. The NEAL treatment is a harmless vegetable remedy, **guaranteed** to remove all desire or craving for liquor. It builds you up—makes a new man of you. Write for booklet to-day.

Drug habit also successfully treated.
